Major aims of our research

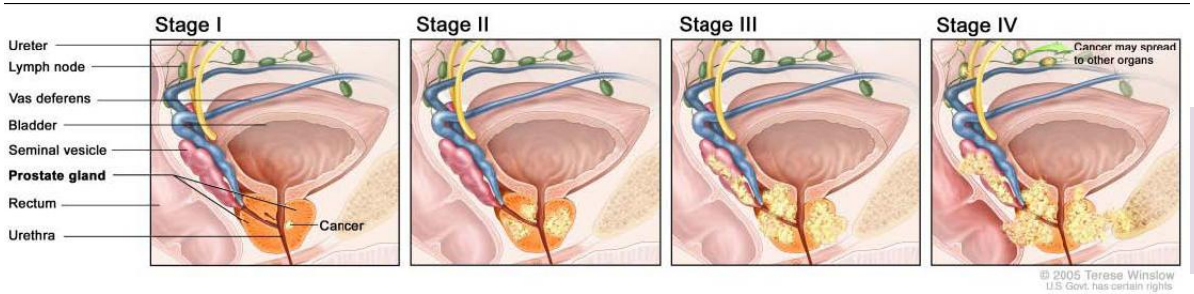
- To identify PCa markers helpful for the diagnosis and prognosis of the aggressive disease.
- To understand the mechanisms implicated in PCa progression to a resistant disease. This may lead to discover more efficient therapeutic targets to eliminate the recurrent metastatic cancer.

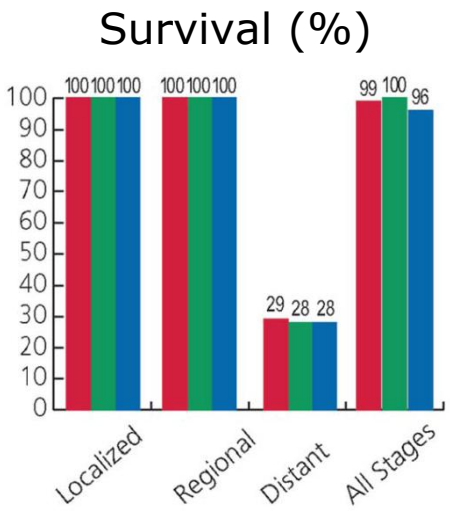
- Discovery of the oncoprotein PTOV1, hints about its function and mechanisms of action in aggressive PCa, and in the resistance to chemotherapy.

- Models systems to study in vitro the biology of PCa and their response to treatments.

PROSTATE CANCER

- Most common neoplasia among males in the western Countries.
- Second leading cause of death from cancer in men.





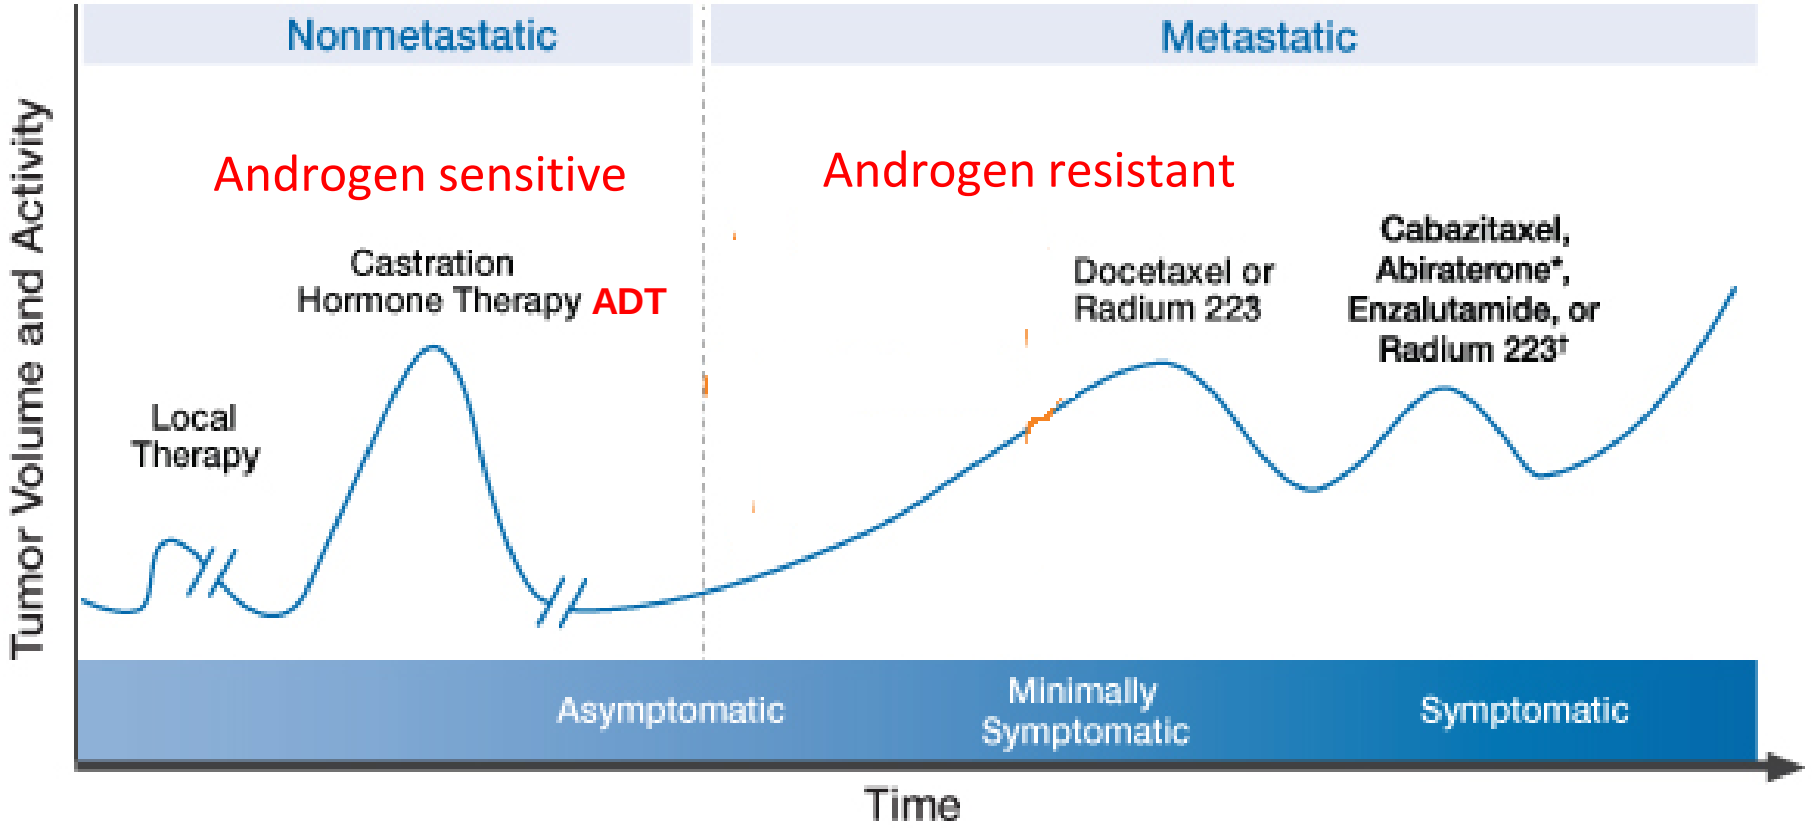
Estimated New Cases*

			Males
Prostate	241,740	29%	
Lung & bronchus	116,470	14%	
Colon & rectum	73,420	9%	
Urinary bladder	55,600	7%	
Melanoma of the skin	44,250	5%	
Kidney & renal pelvis	40,250	5%	
Non-Hodgkin lymphoma	38,160	4%	
Oral cavity & pharynx	28,540	3%	
Leukemia	26,830	3%	
Pancreas	22,090	3%	
All Sites	**848,170**	**100%**	

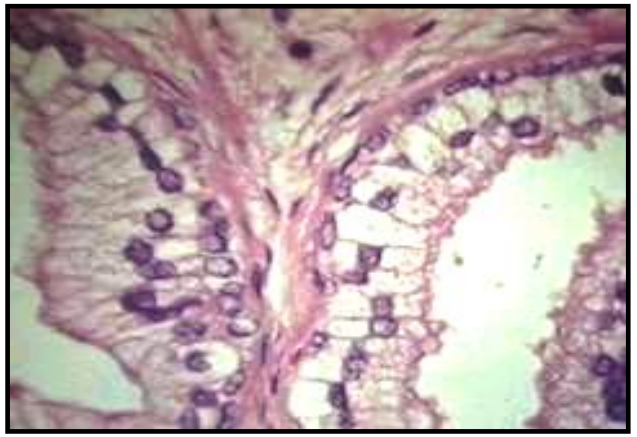
Estimated Deaths

			Males
Lung & bronchus	87,750	29%	
Prostate	28,170	9%	
Colon & rectum	26,470	9%	
Pancreas	18,850	6%	
Liver & intrahepatic bile duct	13,980	5%	
Leukemia	13,500	4%	
Esophagus	12,040	4%	
Urinary bladder	10,510	3%	
Non-Hodgkin lymphoma	10,320	3%	
Kidney & renal pelvis	8,650	3%	
All Sites	**301,820**	**100%**	

Therapeutic approaches for Prostate Cancer progression



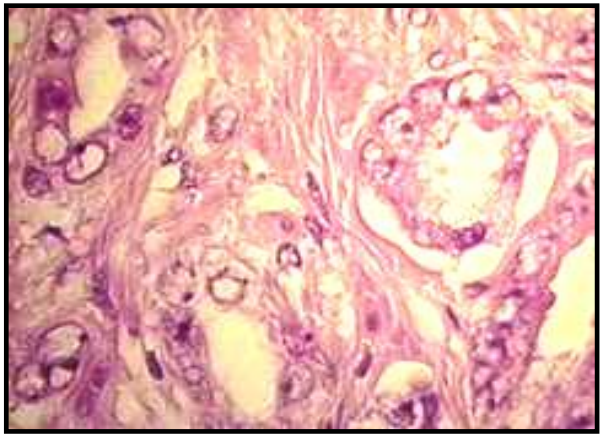
Progression of human Prostate Cancer



Normal Prostate

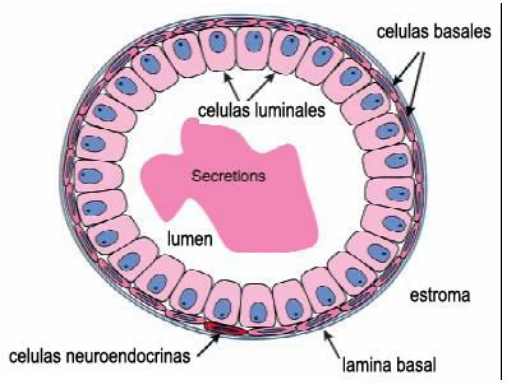
Pre-malignant

(HG-PIN)



Localized Tumor
Androgen-independent

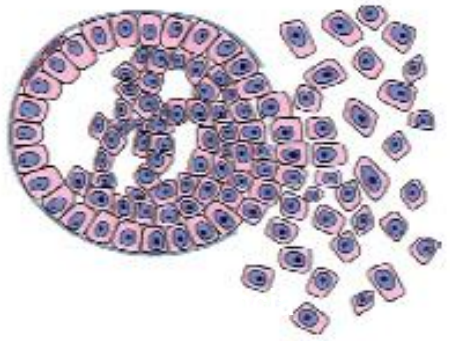
Normal Epithelia



HG-PIN

Localized Tumor

Metastasis



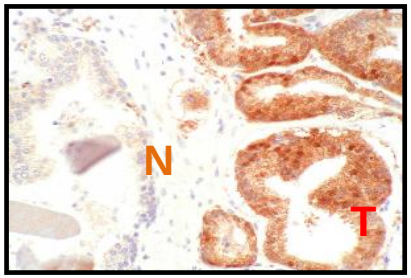
Discovery of the oncoprotein PTOV1

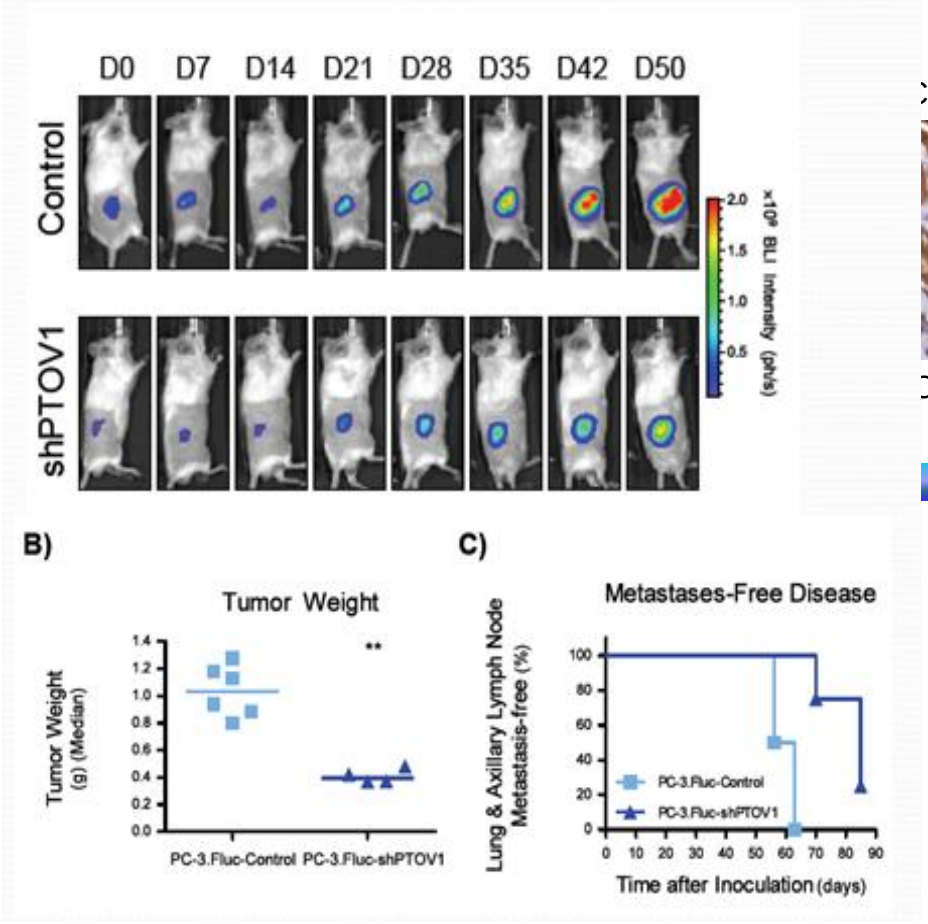
Function and mechanisms of action in aggressive PCa, and in the resistance to chemotherapy

Discovery of the oncoprotein Prostate Tumor Overexpressed-1, PTOV1

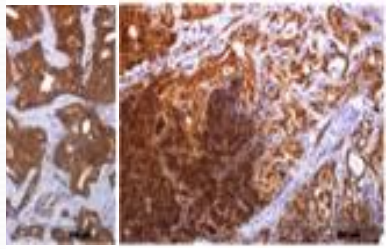
PTOV1 is required for full tumor growth and metastasis of PC3 cells

Human Prostate Cancer





Cancer Progression



Ca Met

Metastasis

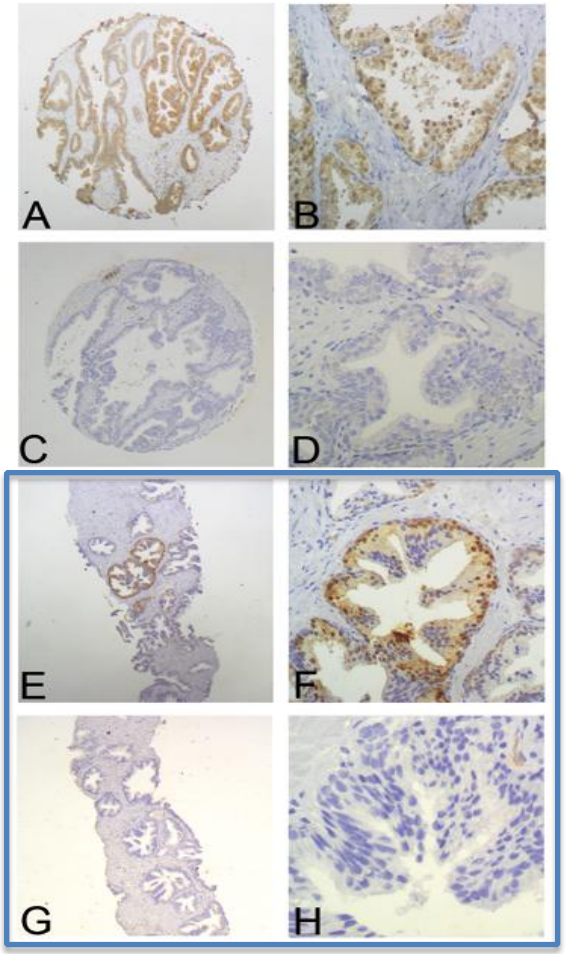
The expression of PTOV1 in pre-neoplastic lesions (HGPIN) found in needle biopsy is associated to the presence of cancer.

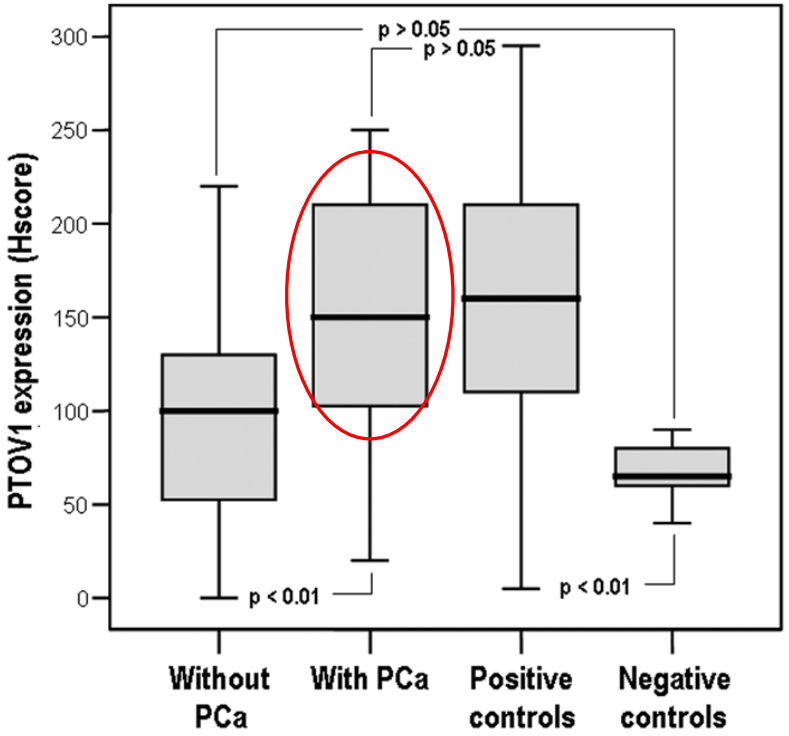
Positive control
Prostate cancer
HG-PIN

Negative control
Normal prostate
HG-PIN

Cancer

No cancer





PTOV1: A NEW GENE FAMILY

PTOV1 Interacts with the Receptor of ACtivated protein Kinase C, RACK1

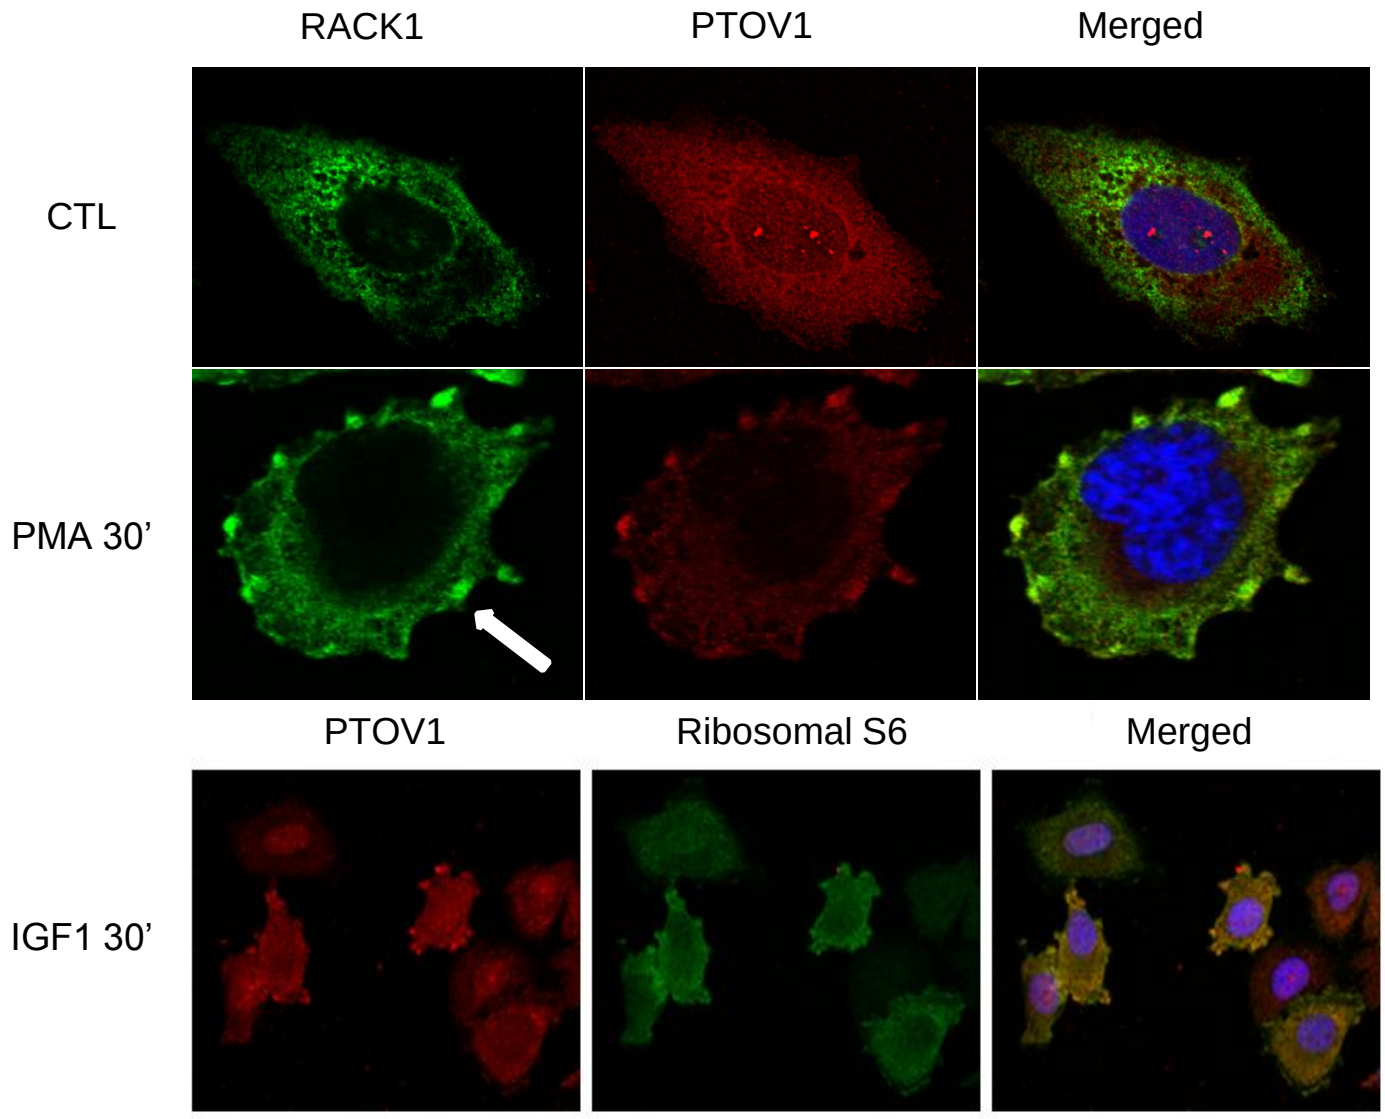
Receptor of ACtivated protein Kinase C,

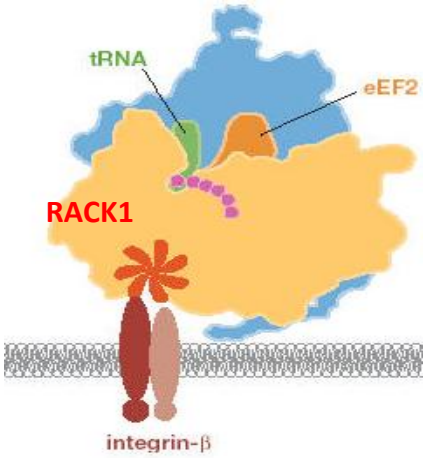
PKCβ, JNK, c-Jun, β-Integrin receptor..

- **Very conserved,** homologous to β-subunits of heterotrimeric G proteins.
- **7 WD repeats,** protein interaction domains**.**
- Regulates cell spreading, focal adhesions and cell-cell contacts
- **Binds to β-subunit of integrin receptor**: important for focal adhesion

- **Subunit of 40S ribosome**
- **Regulates translation initiation:** its recruitment of PKC allows the formation of the 80S.

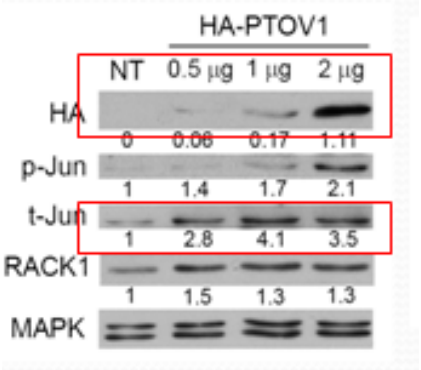
PTOV1 associate with RACK1 and ribosomes after activation with growth factors



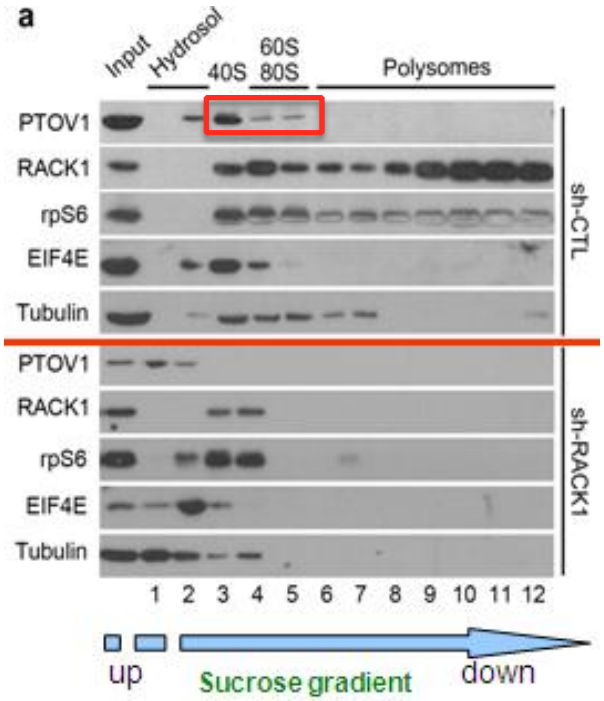


PTOV1 binds to ribosomes through RACK1 and promotes the translation of subsets of mRNAs, including *c-Jun*

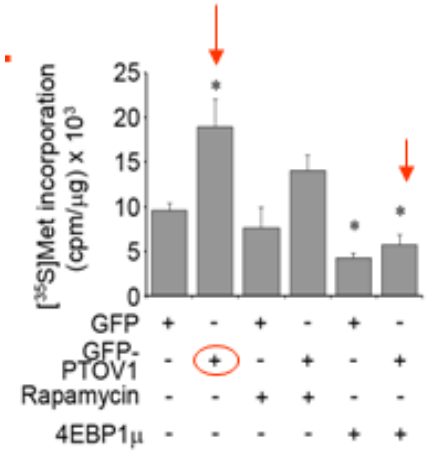
Increased PTOV1 produced increased translation of c-Jun protein



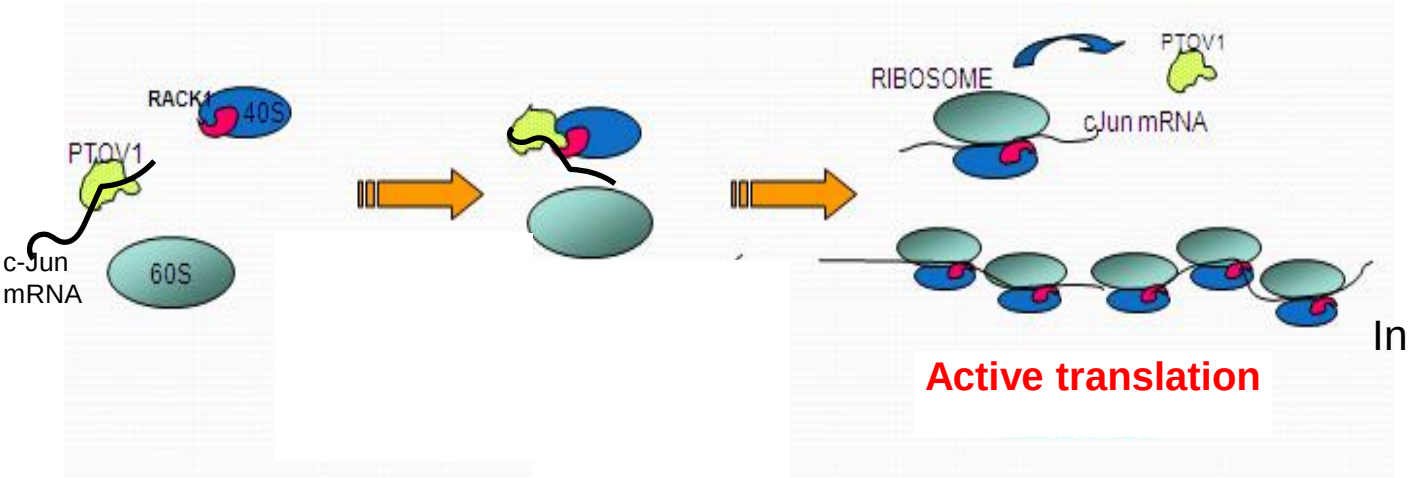
The protein binds to RACK1 on 40S ribosome, but not to polysomes

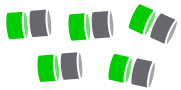


PTOV1 overexpression increased global protein synthesis



The complex PTOV1 /*c-Jun* RNA binds the 40S ribosomes and promotes translation of subsets of mRNAs, including *c-Jun*





Increased levels c-Jun/AP1 oncoproteins

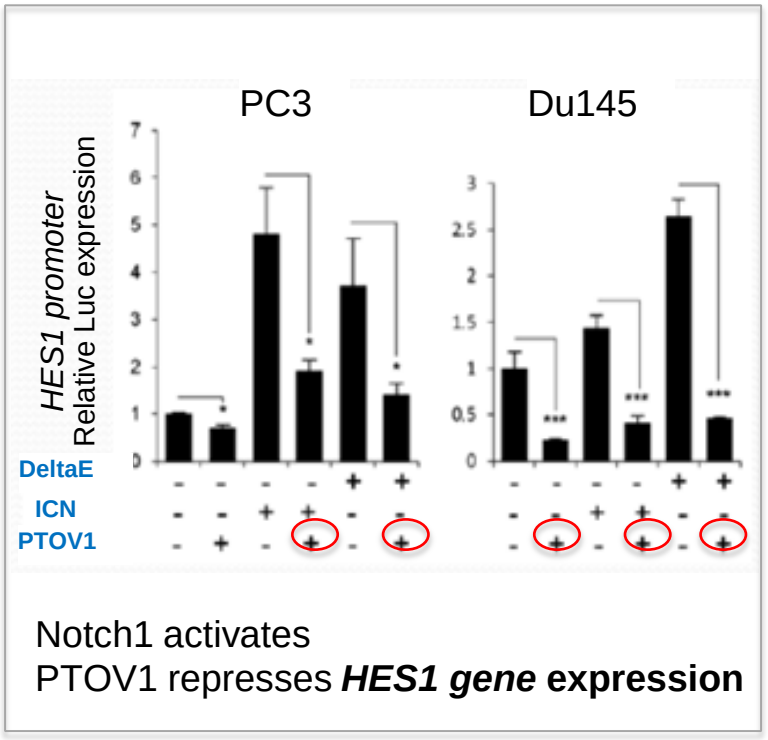
Mesenchymal gene program
(↑ Snail1, N-Cad, Vim... ↓ E-Cad)

Invasion and metastasis

IN THE NUCLEUS:

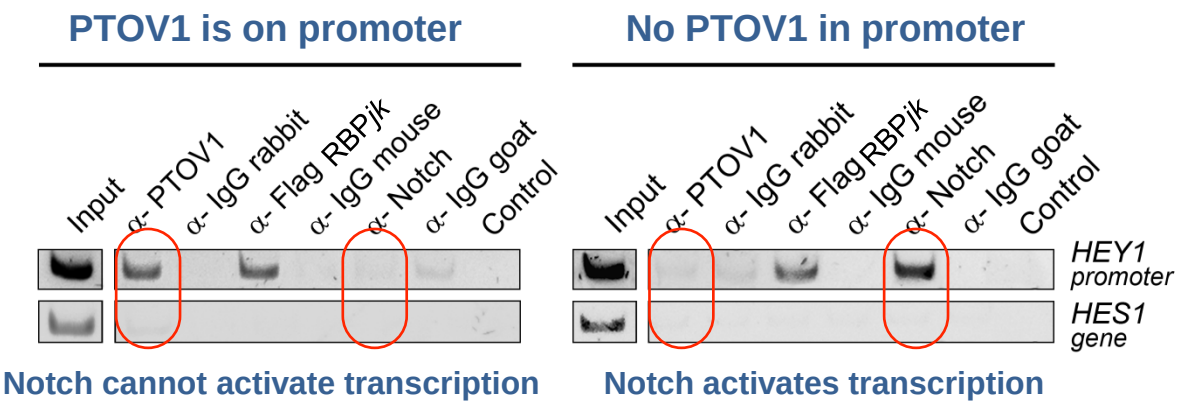
Oncogenic PTOV1 represses transcription downstream of the Notch receptor

HES1 promoter activity



Notch1 activates
PTOV1 represses ***HES1 gene*** **expression**

Chromatin Imm. Precipitation

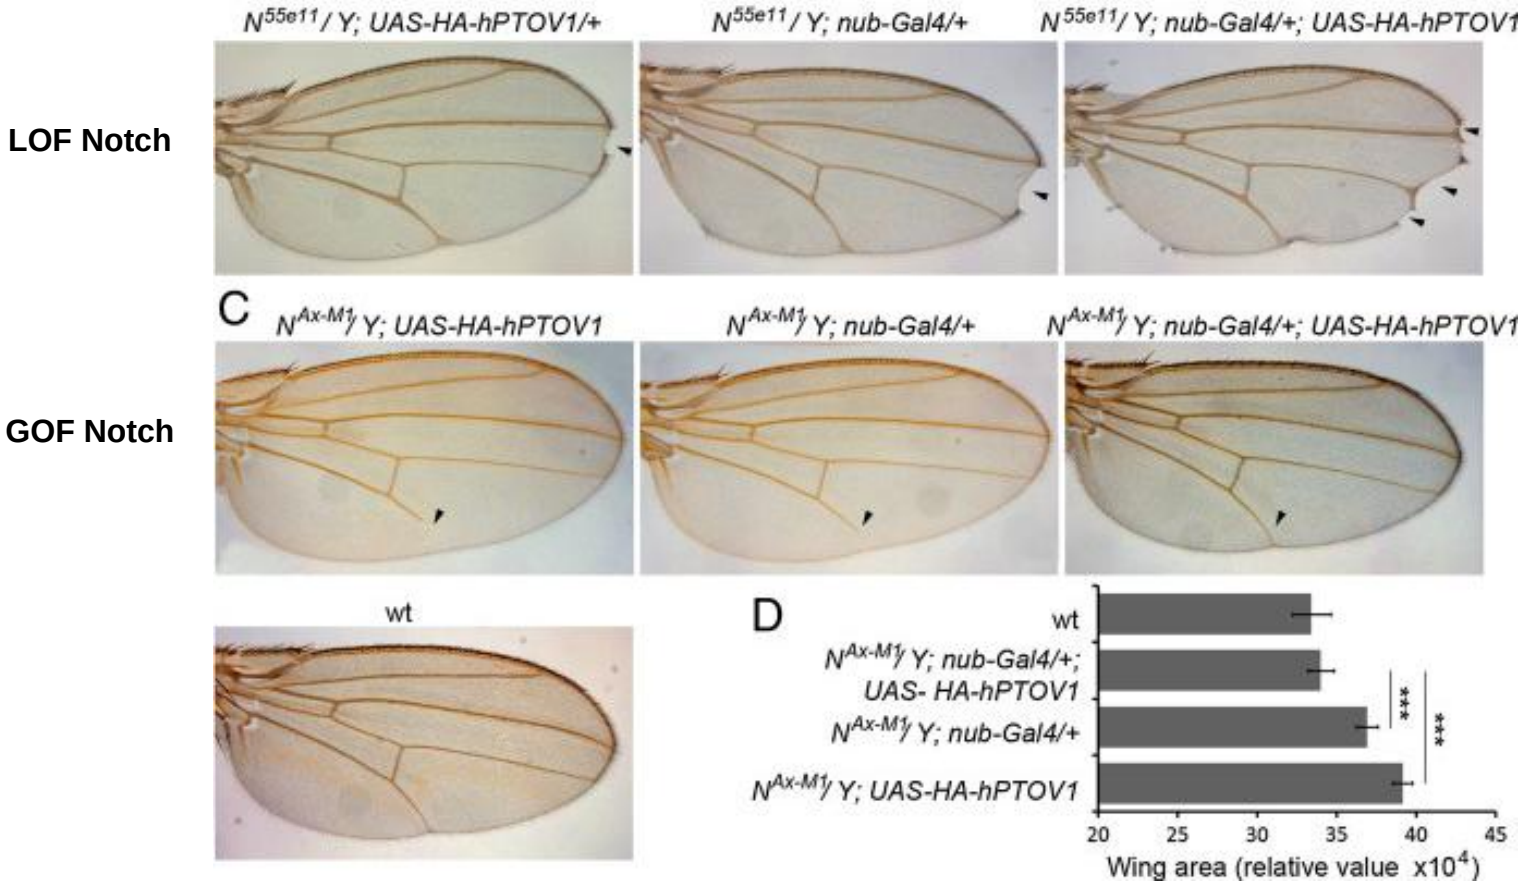


Notch cannot activate transcription

Notch activates transcription

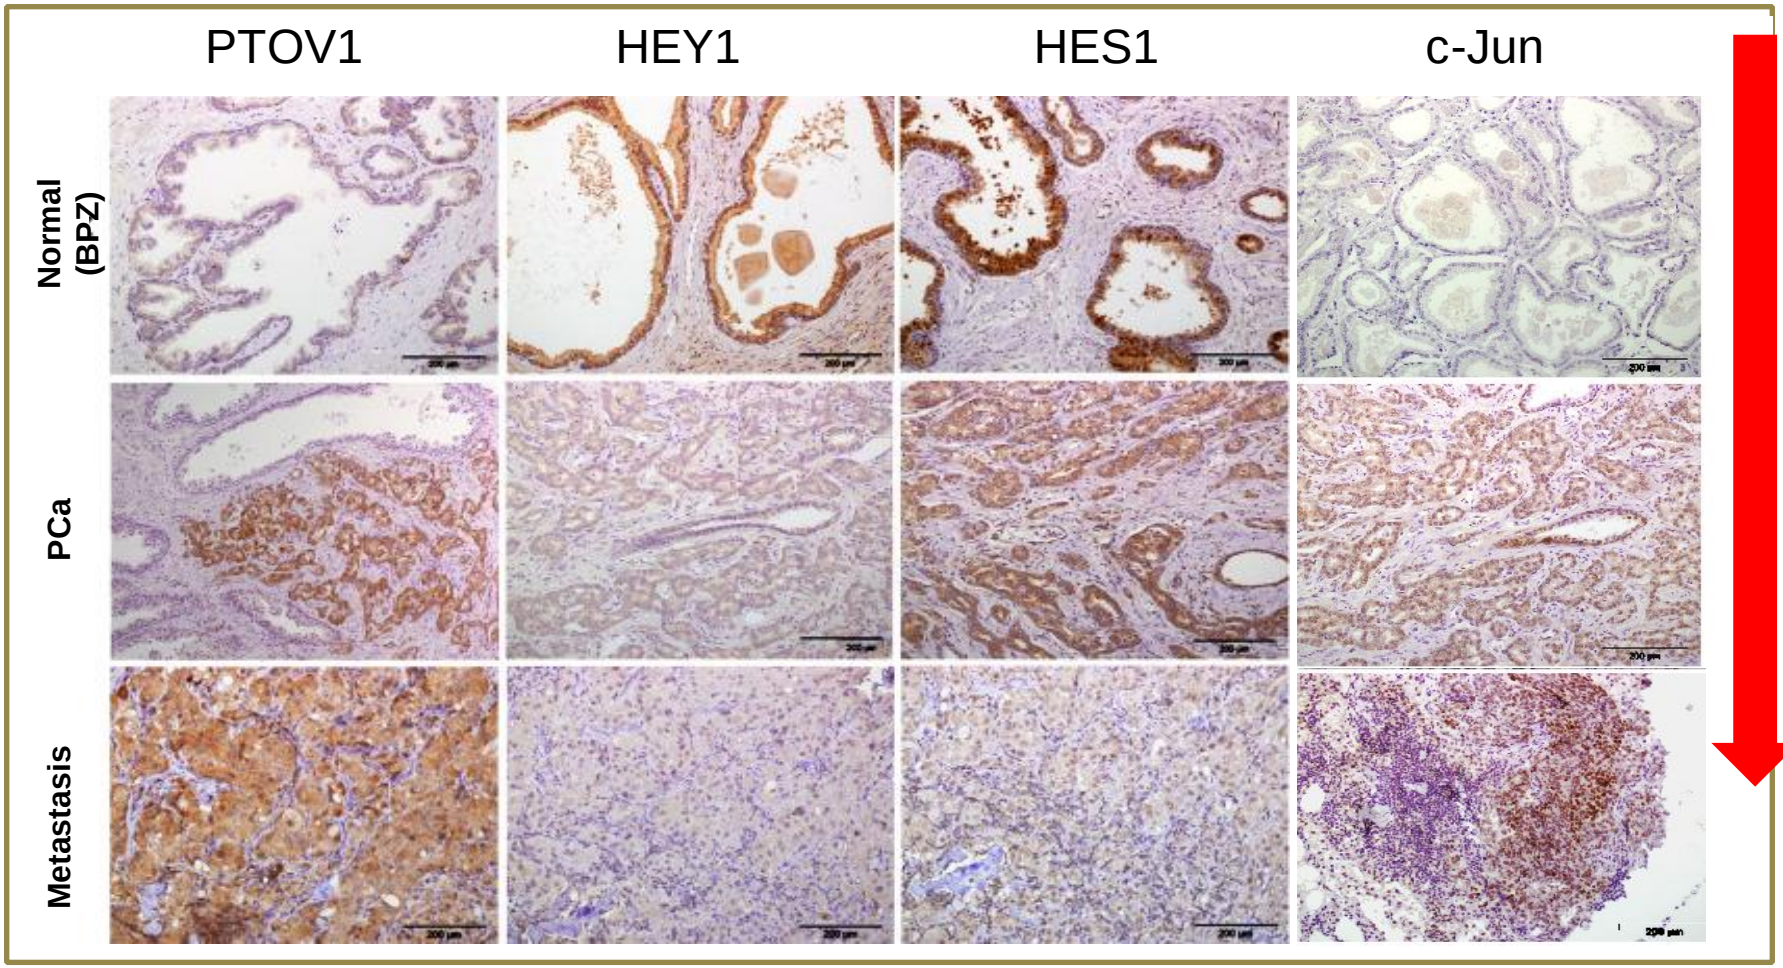
In the prostate
PTOV1 is oncogenic and
counteracts with
NOTCH tumor-suppressor functions

hPTOV1 antagonizes Notch activity in the Drosophila wing model

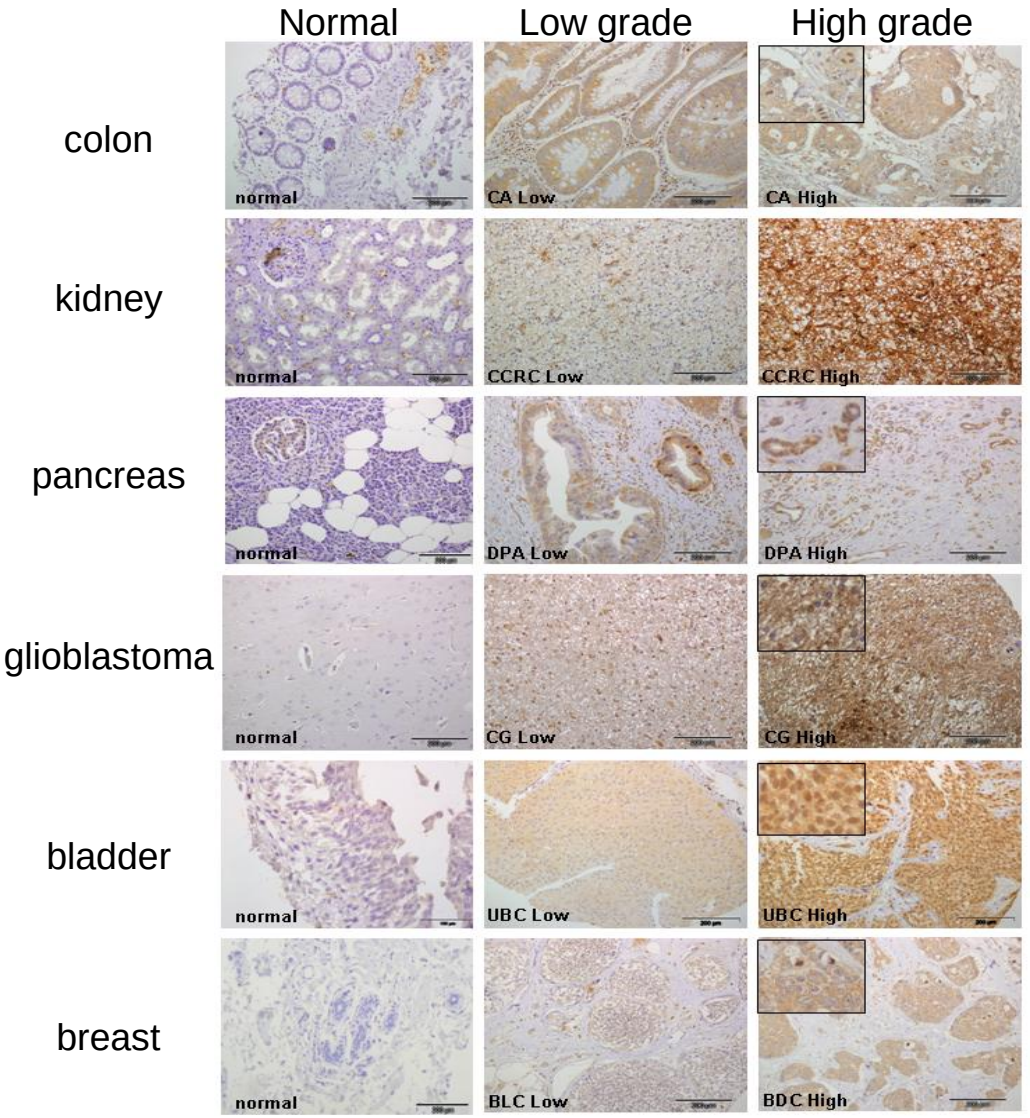


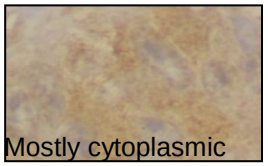
The expression of hPTOV1 increases the effects of Notch loss-of-function (LOF) and suppresses the effects of Notch gain-of-function (GOF).

Coordinated expression in prostate cancer progression



PTOV1 is overexpressed in several tumor types and significantly associated to high grade malignant tumors





Low *vs* High
p = 0.045,
Cramer's coeff. = 0.25

For bladder
Low *vs* High *p* = **0.026**,
Cramer's coeff. = **0.84**

VHIR

Vall d'Hebron Institut de Recerca

PTOV1 is an independent prognostic factor associated with cancer progression and poor survival in several neoplasias

- ***AR* negative**
- PSA negative
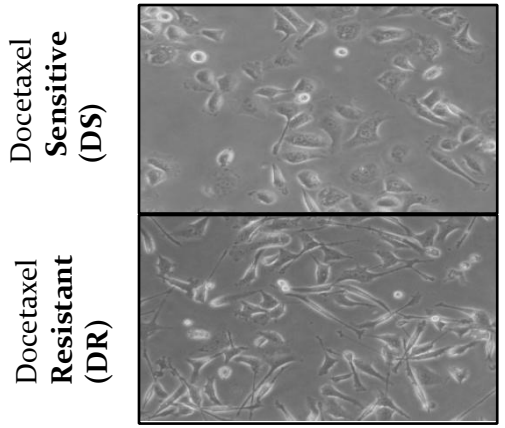
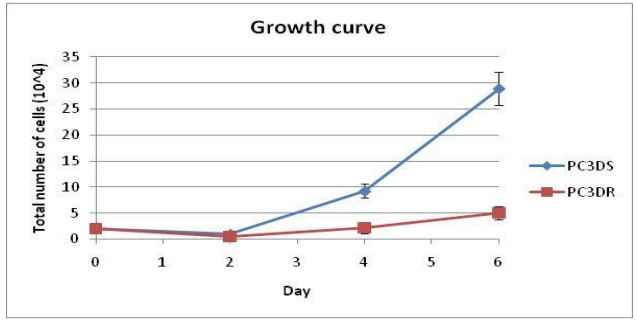
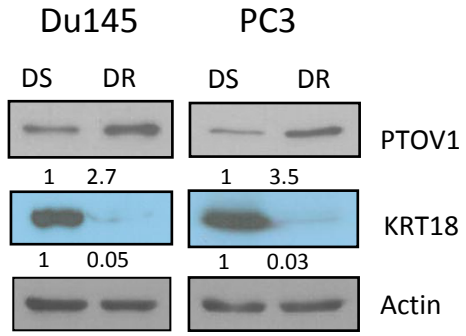
- ETV4+ overexpr.





'mutation status' from Barbieri et al, Eur Urology 2013

PTOV1 overexpressed in CRPC cells sensitive to docetaxel promotes their resistance to chemotherapy



Du145

IC_{50} : 2.0 nM DS-GFP

IC_{50} : 3.9 nM DS-HAPTOV1

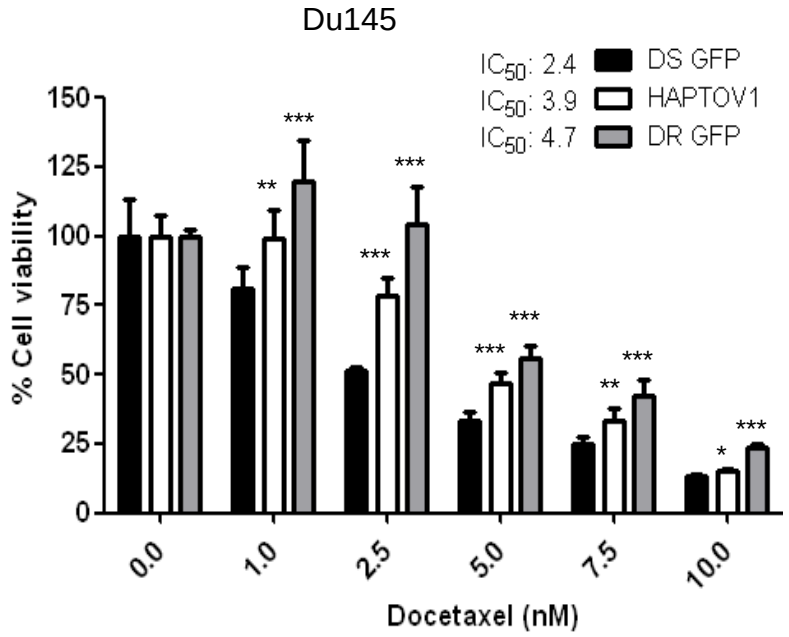
IC_{50} : 5.3 nM DR

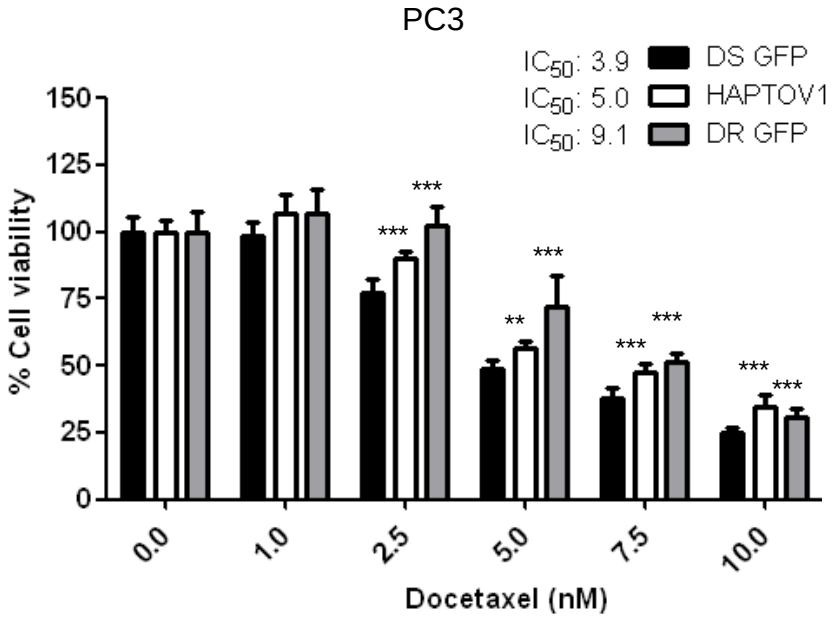
PC3

IC_{50} : 4.8 nM DS-GFP

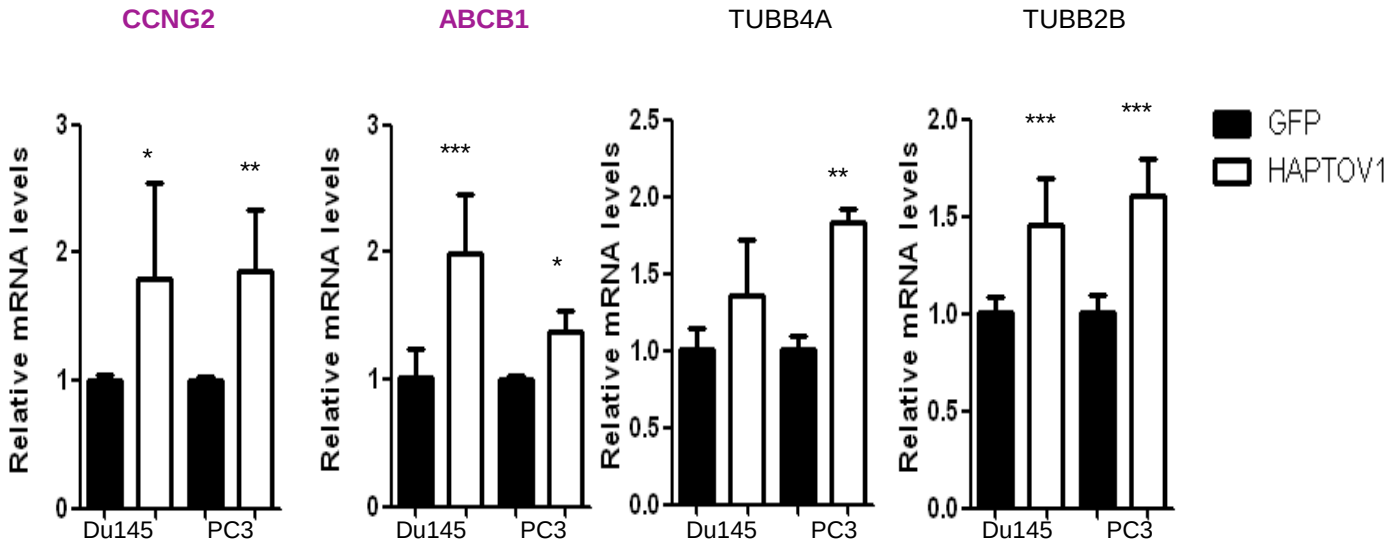
IC_{50} : 5.6 nM DS-HAPTOV1

IC_{50} : 7.2 nM DR

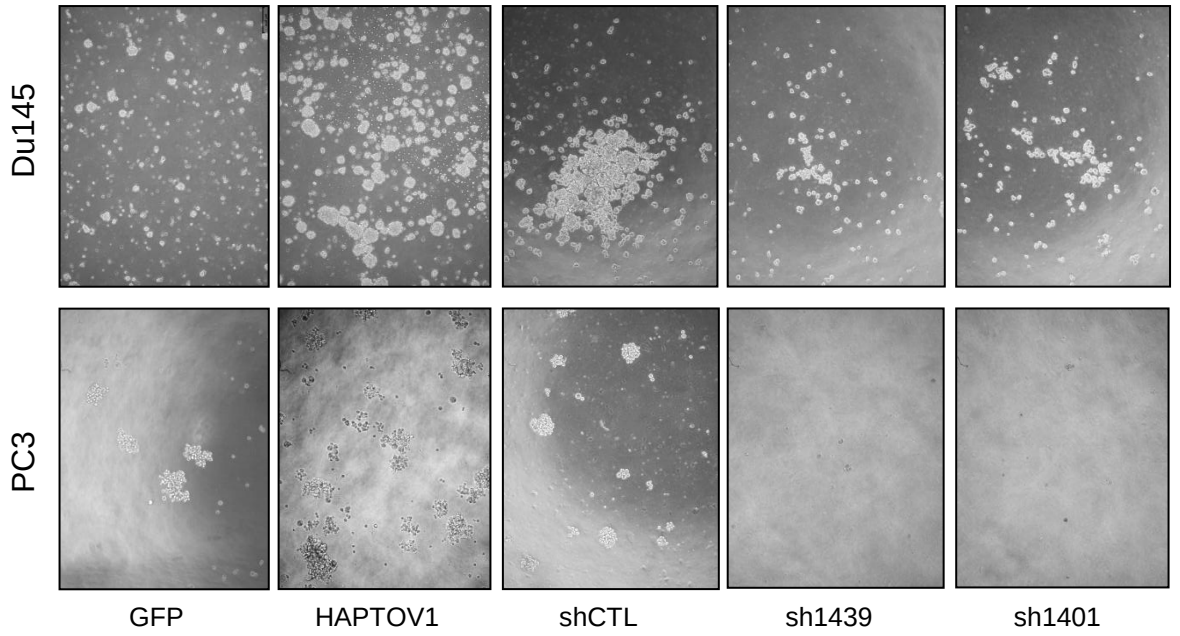


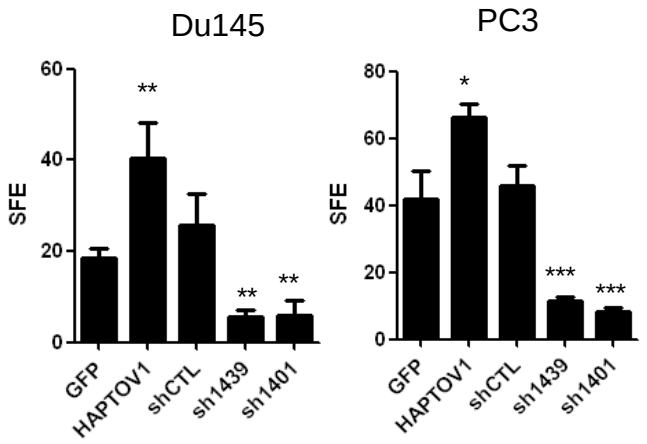


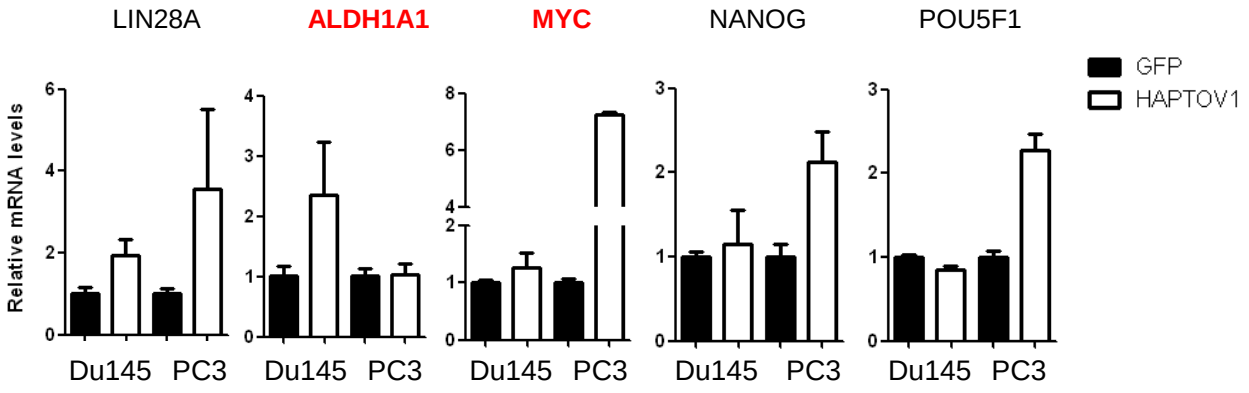
The overexpression of PTOV1 induces an increase of expression of genes associated to resistance to chemotherapy



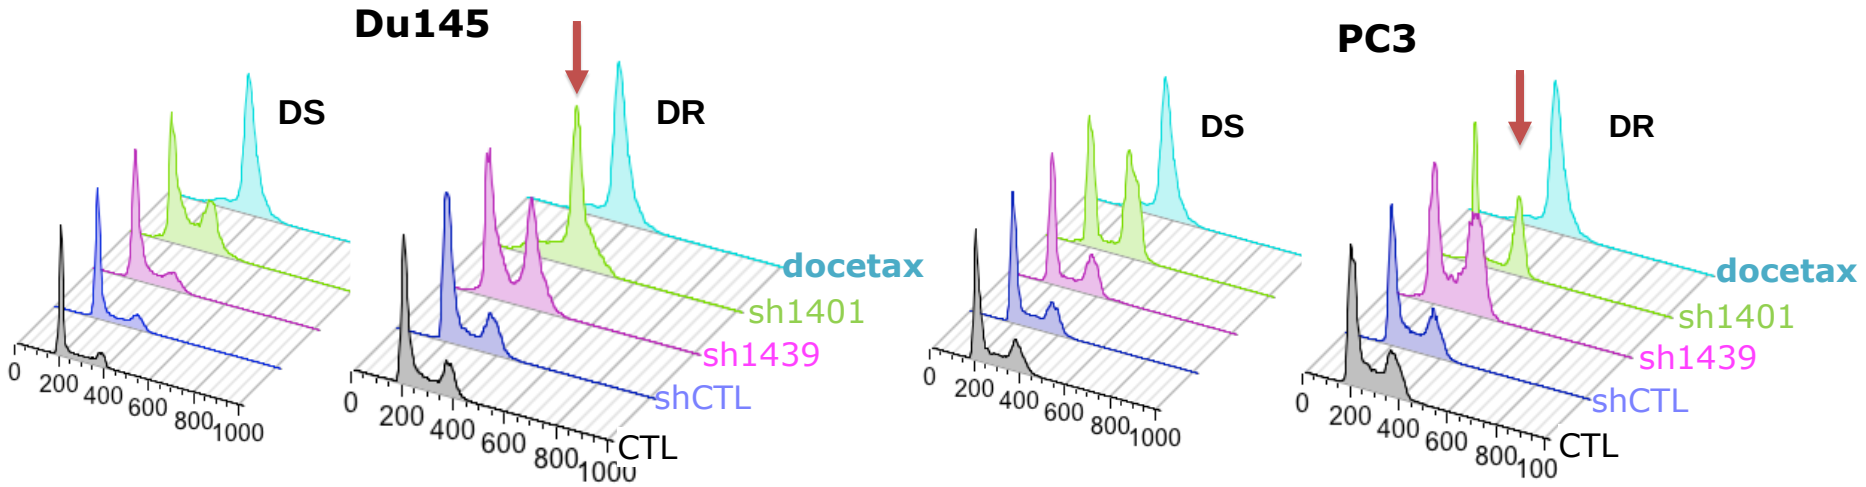
Higher levels of PTOV1 increase the spheroid forming capacity and expression of stemness genes

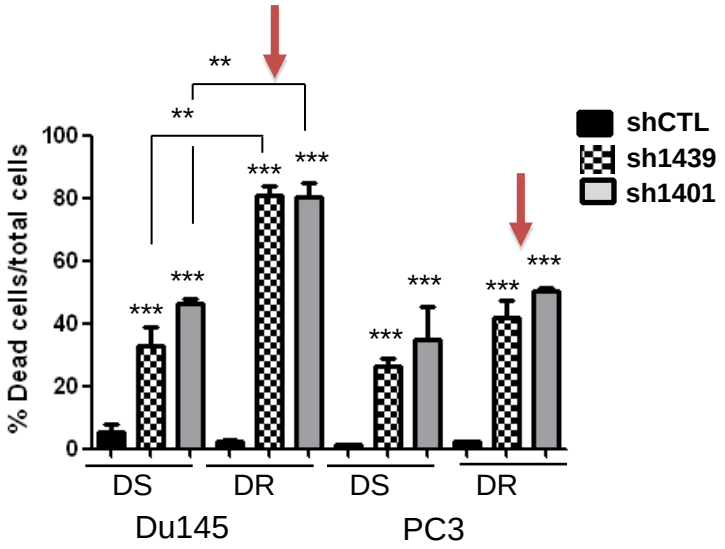




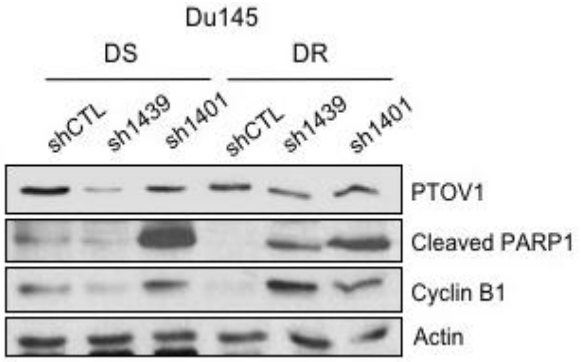


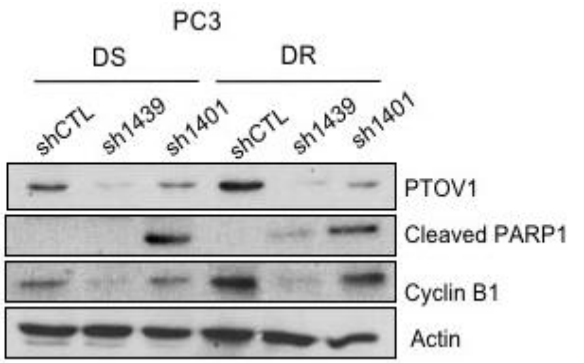
The KD of PTOV1 arrested cells at the G2-M phase. Apoptosis is observed. DR cells are more sensitive



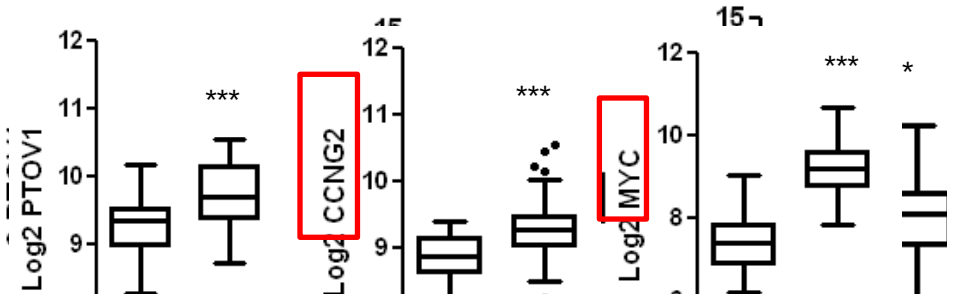


Cells arrest at G2-M phase and show a significant increase in apoptosis.





The expression of *PTOV1, ALDH1A1, CCNG2* and *MYC* is significantly increased in human prostate tumors



GSE29079;
benign n=48; tumor n=47
