TITLE RUNNING HEAD: Total Synthesis of Entecavir

CORRESPONDING AUTHOR FOOTNOTE: Corresponding author. Tel.: +34 934021248; fax: +34 933397878.

ABSTRACT:

Entecavir (BMS-200475) was synthesized from 4-trimethylsilyl-3-butyn-2-one and acrolein. The key features of its preparation are: (i) a stereoselective boron-aldol reaction to afford the acyclic carbon skeleton of the methylene cyclopentane moiety; (ii) its cyclization by a Cp₂TiCl-catalyzed intramolecular radical addition of an epoxide to an alkyne; and (iii) the coupling with a purine derivative by a
Mitsunobu reaction.

KEYWORDS. Hepatitis B, antiviral, total synthesis, aldol reaction, radical cyclization, carbocyclic nucleoside

**Introduction**

B-type hepatitis is a global disease. It is one of the most common viral infections worldwide despite an efficient vaccine being available since 1982. According to the World Health Organization (WHO) about two billion people are infected worldwide and 600,000 die every year due to consequences such as cirrhosis of the liver or liver cancer. Hepatitis B can manifest itself in both acute and chronic forms and is especially dangerous in children. About 90% of infants infected during the first year of life develop chronic infections, although this ratio drops to 30-50% in children infected between the ages of one and four. About 25% of adults who become chronically infected during childhood will die from hepatitis B-related liver cancer or cirrhosis while about 90% of people who become infected during adulthood will recover and be completely free of the virus within six months. About 240 million people are thought to be chronically infected with the disease worldwide.¹

In its chronic form hepatitis B can be treated with interferon or antiviral agents. The most frequently used antiviral agents against hepatitis B virus (HBV) are entecavir (I), tenofovir, adefovir, telbivudine, and lamivudine (Figure 1).²
Of these, entecavir is considered one of the best choices for the treatment of chronic patients due to its lack of significant adverse effects and the low risk of inducing long-term resistance to the drug.\textsuperscript{3}

Entecavir (BMS-200475), first synthesized by Bristol-Myers Squibb,\textsuperscript{4} was identified as a potent inhibitor of HBV in vitro ($ED_{50} = 3$ nM)\textsuperscript{5} and was later commercialized as Baraclude®. Its patent is due to expire in 2015 in the US and soon afterwards in other countries. In anticipation of the availability of a generic version, a plethora of patent applications has appeared recently.\textsuperscript{6,8a-b} Most the reported synthetic approaches for the stereoselective construction of the cyclopentane framework are based on transformation of a cyclopentane moiety,\textsuperscript{6,7} and only a few start with an acyclic precursor that is subsequently cyclized.\textsuperscript{8} In this paper we disclose a concise synthesis of 1 from acyclic precursors.\textsuperscript{9} As shown in Scheme 1, the retrosynthetic analysis of this carbocyclic nucleoside\textsuperscript{10} takes advantage of the ability of epoxides to act as effective precursors of radicals. The key step involves the Ti(III)-mediated generation of a $\beta$-alkoxy carbon radical\textsuperscript{11} from epoxide 4 that can cyclize to a methylene cyclopentane 5 through the cyclic transition state shown in Figure 2.
It is worth noting that the proposed radical cyclization has been reported previously in a failed attempt to prepare 1. Thus, Ziegler\textsuperscript{12} prepared epoxide 4b (PG\textsubscript{1} = PG\textsubscript{2} = TBS) from protected D-glucose in 9 steps and reported very good cyclization yields when 4b was treated with 3 equiv of Cp\textsubscript{2}TiCl\textsubscript{2} in the presence of an excess of Zn in THF. Considering these precedents, we implemented an alternative route to epoxides 4 where the key step is an enantioselective acetate aldol addition\textsuperscript{13} of methyl ketone 2 to acrolein followed by the in situ reduction of the corresponding β-hydroxy ketone. This approach drastically reduces the number of steps involved and potentially provides more flexibility with respect to the election of protecting groups (PG\textsubscript{1} and PG\textsubscript{2}).
Results and Discussion

The enantioselective aldol reaction of 4-trimethylsilyl-3-butyne-2-one (2) with acrolein was carried out using (+)-chlorodiisopinocampheylborane ((+)-DIPCl) as source of chirality.\textsuperscript{14} As shown in Scheme 2, the \textit{in situ} reduction of the resulting chelate\textsuperscript{15} with LiBH\textsubscript{4} followed by an oxidative work up provided 3a (PG\textsubscript{1}=PG\textsubscript{2}=H) as a mixture of diols in 66\% yield and moderate selectivity (80:20 er, 90:10 \textit{syn/anti} ratio) after chromatography. It is worth noting that recrystallization from hexanes afforded pure \textit{syn} diol 3a (98\% er, >99\% dr) in 37\% overall yield. Despite the low yield, this method is very straightforward and allows the skeleton of the cyclization precursor 4 to be constructed from easily available commercial starting materials in a one-pot procedure.

\begin{center}
\textbf{Scheme 2}
\end{center}

Conversion of 3a into the Ziegler’s epoxide 4b or its TMS-derivative 6 is very efficient (Scheme 3). Unfortunately, the cyclization of 4b leads to the methylene cyclopentane 5b (PG\textsubscript{1}=PG\textsubscript{2}=TBS, PG\textsubscript{3}=H, Scheme 1) where the differentiation of TBS ethers would be problematic during the introduction of the nucleobase. On the other hand, our preliminary attempts at the cyclization of epoxide 6 led to the complete degradation of the starting material. With a view to circumventing these limitations we evaluated the cyclization reactions for a series of epoxides of type 4 with different protecting groups.
Preparation of 4 (PG₁=PG₂) from 3a or 7a is not trivial in some cases because there is no reliable information in the literature on the selective monoprotection of secondary propargylic alcohols in the presence of secondary allylic ones. In order to establish the viability of the monoprotection reactions, a set of silylations and benzyolations were carried out on these diols. Table 1 summarizes the optimized conditions found for each substrate and highlights the fact that protection of the propargylic position is clearly favored over the protection of the corresponding allylic position. Moderate-to-good yields of the desired monoprotected diol can be achieved while at the same time maintaining the yields of diprotected byproducts below 15%. Yields of the monoprotected allylic alcohol are less than 5%.

*a R’Cl (1.1 equiv) was added.

Based on these results, we attempted to prepare the diprotected epoxides 4g–j (Scheme 4) through selective monoprotection of 3a followed by the removal of the TMS group to afford 7c–e monoalcohols. The sequence was completed by epoxidation with m-CPBA and final protection of the remaining alcohol. The alternative pathway, in which the epoxidation was the final step was less convenient since the epoxidation of protected allylic alcohols is slow and it is even slower with acetylated allylic alcohols. On the other hand, for the preparation of 4k via 7f removal of the TMS group of 3a to afford diol 7a was the first step in the sequence since this deprotection was not compatible with a benzoate group.
With epoxides 4g-k in hand, we attempted to bring about their Ti(III)-mediated cyclization by treatment with Cp₂TiCl₂ in the presence of an excess of a metal M such as Zn or Mn (Scheme 5). In this type of reaction the metal reduces Cp₂TiCl₂ to a Cp₂TiCl· radical (8). Reaction of 8 with the corresponding epoxide 4 generates the titanocene(IV) β-alkoxy carbon radical 9 that gives rise to a cyclic vinyl radical 10. This radical can then be quenched either by a hydrogen donor or by another Ti(III) radical to afford 11 or 12 (X=H or Cp₂TiCl, respectively). Protonolysis of 11/12 should give methylene cyclopentane 5.

Although this reaction can be catalytic in Cp₂TiCl₂, Ziegler¹² described the cyclization of epoxide 4b
using an excess of Cp₂TiCl₂. Under these conditions, however, we could not reproduce the reported yield. When epoxide 4b was treated with Cp₂TiCl₂ in the presence of an excess of Zn following the described procedure, the methylene cyclopropane 5b (PG₁=PG₂=TBS, PG₃=H) was obtained with good diastereoselectivity but in a yield of only 30%.

![Scheme 5](image_url)

Scheme 5

Fortunately, yields could be increased to 50% by replacing the aqueous H₂SO₄ work-up with a treatment with saturated NH₄Cl (entry 1, Table 2). Under these optimized conditions cyclizations of epoxides 4g-k were carried out. The results are summarized in Table 2 and it can be seen that the election of the propargylic alcohol protecting group (R) is critical. TBS provided the best yields (entries 1, 2, and 5) when compared with TIPS and TBDPS (entries 3 and 6) and better selectivity than the benzoyl group (entry 4). In sharp contrast, protection of the allylic alcohol has little effect on yield or selectivity (entries 1, 2, and 5). These results suggested 4b, 4g and 4h to be the most promising candidates for cyclization. We finally chose the transformation of 4g to 5g as the key step of the synthesis because it provided better overall yield from diol 3a and allowed differentiation of the protected alcohols.

**TABLE 2. Stoichiometric cyclization of propargylic epoxides 4b and 4g-k.**
The Ti-catalytic version of the cyclization was also explored in an attempt to improve the process. In the stoichiometric process 11/12 are cleaved in the final step by treatment with saturated NH₄Cl. In the catalytic version an alternative proton source is required to cleave 11/12 and regenerate the catalyst. Gansäuer²⁶ described the use of collidine hydrochloride as the most convenient reagent for doing so.

After careful optimization of the reaction conditions we were able to carry out the cyclization of 4g to 5g using 20% catalyst and collidine hydrochloride as proton source with excellent selectivity and comparable yields to the stoichiometric version (Table 3, entries 1 and 4). Mn provides similar yields to Zn but requires less metal to generate 8.

On the other hand, we found that the use of trimethylsilylcollidinium chloride¹⁷ instead of collidine hydrochloride (entries 2 and 5) while not improving yields did improve the reproducibility of the process at larger scales. A further improvement was achieved by introducing Vaska’s complex, IrCl(CO)(PPh₃)₂ in the presence of H₂ as hydrogen donor¹⁸ (entries 3, 6, and 7).

**TABLE 3. Catalytic cyclization of 4g to cyclopentane 5g.**
The last step in the preparation of the carbocyclic moiety of Entecavir was the protection of the primary hydroxyl group of 5g in the form of a p-nitrobenzoyl ester 5l. The election of this protecting group is important because 5l can be crystallized and purified. By this means chromatographic purifications of intermediates 3a to 5g (which are oils) can be avoided (Scheme 6).
Final conversion of 5l to pharmaceutical-grade Entecavir was straightforward. Selective acidic deprotection of the TBS ether followed by Mitsunobu reaction with 2-amino-6-chloropurine led to the chloroderivative 13 that was transformed into protected Entecavir 14 by treatment with formic acid. Saponification of 14 then gave Entecavir of pharmaceutical grade. Reversal of the order of the last two
steps decreased the overall yield and increased the formation of impurities that impeded the crystallization of the final product as did the direct acid hydrolysis of both of the esters and the chloropurine moiety.

**Conclusions**

A straightforward synthesis of Entecavir was achieved in 11 steps from commercially available starting materials. The cyclopentane skeleton was prepared from acyclic precursors by a boron-aldol reaction and a Ti(III)-catalyzed cyclization of an epoxide to an alkyne as key steps. The carbocyclic structure obtained in this way was attached to a purine moiety by a Mitsunobu reaction. It is worth mentioning that the use of the \( p \)-nitrobenzoyl group in the final steps allows purification by crystallization thus avoiding chromatography and making the synthesis amenable to scale-up. The selective hydrolysis of the 6-chloropurine unit with formic acid is also essential in order to facilitate the crystallization of the final product.

**Experimental Section**

All reactions involving moisture- or air-sensitive reagents were performed in oven-dried glassware under \( \text{N}_2 \). Chemical shifts (\( \delta \)) were quoted in parts per million and referenced for \(^1\text{H} \) NMR to internal TMS (for CDCl\(_3\)) or residual solvent peak \( \delta \) 2.50 ppm (for DMSO-\( d_6 \)). \(^{13}\text{C} \) NMR was referenced to CDCl\(_3\) (\( \delta \) 77.0 ppm) or DMSO-\( d_6 \) (\( \delta \) 39.5 ppm). Column chromatography was performed on silica gel (Merck 230-400 mesh). HRMS analyses were recorded on a LC/MSD-TOF mass spectrometer.

\((3S,5R)-7-(\text{Trimethylsilyl})\text{hept-1-en-6-yne-3,5-diol (3a)}\). NEt\(_3\) (11.60 mL, 85 mmol) was added to a stirred solution of (+)–DIPCl (90-105%) (25.000 g, 78 mmol) in anhydrous THF (40 mL) under \( \text{N}_2 \) at 0 °C. 4-Trimethylsilyl-3-butyln-2-one (98%, 9.78 g, 70 mmol) was added dropwise and the mixture was stirred for 2 h at -5 °C–0 °C. The solution was cooled to -78 °C and a solution of acrolein (90%, 7.62 mL, 103 mmol) in anhydrous THF (20 mL) was added slowly and the mixture was stirred for 1 h at -78 °C. A 2 M solution of LiBH\(_4\) in hexanes (53 mL, 106 mmol) was added slowly and the mixture was stirred for a further 1 h at -78 °C. After careful quenching with saturated NH\(_4\)Cl (40 mL) at -78 °C the
mixture was allowed to warm to rt over 30 min. After partitioning between H$_2$O (40 mL) and MTBE (90 mL) the aqueous layer was extracted with MTBE (25 mL). The organic phases were combined and dried (MgSO$_4$). Solvent removal afforded a pale yellow oil (62 g). THF:H$_2$O (3:1, 80 mL) was added under N$_2$ at rt followed by NaOAc (4.40 g, 54 mmol) and the mixture was cooled to 0 ºC. H$_2$O$_2$ (30%, 30 mL, 5 equiv) was added dropwise over 10 min and the mixture was stirred for a further 10 min at 0 ºC and 30 min at rt. After cooling to 0 ºC a saturated solution of Na$_2$S$_2$O$_3$ (30 mL) was added slowly and the mixture was stirred for 10 min at 0 ºC and 15 min at rt. H$_2$O (20 mL) and MTBE (35 mL) were added and the organic phase was decanted. The aqueous layer was extracted with MTBE (10 mL) and the combined organic extracts were dried (MgSO$_4$). Solvent removal gave a clear oil (49.2 g) that was purified by flash chromatography [silica gel, hexanes-AcOEt, from 90:10 to 60:40 (gradient elution)] to give 9.130 g of a mixture of diols (er 80:20; syn/anti 90:10).

Recrystallization from hexanes afforded the product as a white crystalline solid (3a, 9a 5.2 g, 37% overall yield, er 98%). Mp 80–82 ºC. [α]$_D$$^{25}$ +2.3 (c 1.0, CHCl$_3$). IR (film): 3349, 2956, 2922, 2899, 2176 cm$^{-1}$. $^1$H NMR (CDCl$_3$, 400 MHz): δ 5.90 (ddd, $J = 17.2, 10.4, 5.9$ Hz, 1H), 5.29 (ddd, $J = 17.2, 1.4, 1.3$ Hz, 1H), 5.14 (ddd, $J = 10.4, 1.4, 1.3$ Hz, 1H), 4.64 (dd, $J = 7.9, 5.2$ Hz, 1H), 4.43-4.37 (m, 1H), 2.80 (bs, 1H), 2.46 (bs, 1H), 2.03-1.89 (m, 2H), 0.18 (s, 9H). $^{13}$C NMR (CDCl$_3$, 101 MHz): δ 140.1, 115.1, 106.1, 89.9, 72.1, 62.0, 44.0, −0.1. (1S,3R)-1-(Oxiran-2-yl)-3-(triisopropylsilyloxy)pent-4-yn-1-ol (4e). A solution of 7e (4.900 g, 17.34 mmol) in anhydrous CH$_2$Cl$_2$ (7 mL) was added to a suspension of m-CPBA (77%, 9.500 g, 42.48 mmol) in anhydrous CH$_2$Cl$_2$ (33 mL) at rt under N$_2$ and the mixture was stirred at rt for 15 h. After filtration the organic phase was washed with saturated Na$_2$S$_2$O$_3$ (20 mL), saturated NaHCO$_3$ (2 × 20 mL) and dried (MgSO$_4$). Solvent removal gave the title compound (4e) as a pale yellow oil (4.920 g, 95%). IR (film): 3447, 3310, 2944, 2867, 2109 cm$^{-1}$. $^1$H NMR (CDCl$_3$, 400 MHz): $\delta$ 4.80-4.74 (m, 1H), 4.09-4.02 (m, 0.4H), 3.87-3.79 (m, 0.6H), 3.11-3.04 (m, 1H), 2.84-2.79 (m, 1H), 2.78-2.74 (m, 1H), 2.49 (d, $J = 2.1$ Hz, 0.4H), 2.47 (d, $J = 2.1$ Hz, 0.6H), 2.10-1.91 (m, 2H), 1.13-1.04 (m, 21H). $^{13}$C NMR (CDCl$_3$, 101 MHz): $\delta$ 84.7, 84.6, 73.6, 73.6, 69.5, 67.5, 61.5, 61.2, 55.4, 54.4, 45.0, 44.2, 42.8, 42.1, 18.1, 18.1, 12.4, 12.3. HRMS (ESI): $m/z$ calcd. for C$_{16}$H$_{31}$O$_3$Si$^+$ [M+H]$^+$ 299.2037; found 299.2035.
(3R,5S)-5-Hydroxy-5-(oxiran-2-yl)pent-1-yn-3-yl benzoate (4f). A solution of 7f (0.500 g, 2.17 mmol, 91:9 mixture of monobenzoylated regioisomers) in anhydrous CH₂Cl₂ (3 mL) was added to a suspension of m-CPBA (77%, 1.460 g, 6.51 mmol) in anhydrous CH₂Cl₂ (2 mL) at rt under N₂ and the mixture was stirred at rt for 15 h. After filtration the organic phase was washed with saturated Na₂S₂O₃ (7 mL), saturated NaHCO₃ (2 × 10 mL) and dried (MgSO₄). Solvent removal gave an oily residue that was purified by flash chromatography [silica gel, hexanes-AcOEt, from 90:10 to 50:50 (gradient elution)] to give the title compound (4f) as a pale yellow oil (0.465 g, 87%, single monobenzoylated regioisomer). IR (film): 3446, 3288, 3063, 2997, 2929, 2121, 1719 cm⁻¹. ¹H NMR (CDCl₃, 400 MHz): δ 8.07-8.01 (m, 2H), 7.60-7.53 (m, 1H), 7.44 (t, J = 7.7 Hz, 2H), 5.89-5.81 (m, 1H), 4.18 (ddd, J = 7.9, 4.8, 3.3 Hz, 0.4H), 3.86 (dt, J = 9.0, 4.6 Hz, 0.6H), 3.09 (ddd, J = 7.4, 6.0, 2.9 Hz, 1H), 2.88-2.81 (m, 1H), 2.79-2.74 (m, 0.6H), 2.72 (dd, J = 5.0, 4.0 Hz, 0.4H), 2.56 (t, J = 1.9 Hz, 1H), 2.32-2.13 (m, 2H). ¹³C NMR (CDCl₃, 101 MHz): δ 165.4, 133.5, 133.4, 129.9, 129.9, 129.6, 129.6, 128.6, 128.5, 80.7, 80.6, 74.9, 74.8, 68.5, 65.9, 62.1, 62.0, 55.1, 54.2, 45.1, 43.7, 39.3, 38.4. HRMS (ESI): m/z calcd. for C₁₄H₁₅O₄⁺ [M+H]⁺ 247.0965; found 247.0966.

(1S,3R)-3-(tert-Butyldimethylsilyloxy)-1-(oxiran-2-yl)pent-4-ynyl acetate (4g). NEt₃ (3.80 mL, 27.89 mmol) was added dropwise to a solution of 4c (5.499 g, 21.45 mmol) and a catalytic amount of DMAP in anhydrous CH₂Cl₂ (50 mL) at 0 ºC under N₂. Ac₂O (2.40 mL, 25.74 mmol) was added dropwise at 0-5 ºC and the mixture was allowed to warm to rt and stirred for 1 h. Saturated NH₄Cl (35 mL) was added slowly and the mixture was stirred for 10 min. After partitioning the aqueous phase was extracted with CH₂Cl₂ (20 mL) and the combined organic phases were washed with saturated NaHCO₃ (30 mL). The aqueous phase was extracted with CH₂Cl₂ (20 mL) and the combined organic phases were dried (MgSO₄) and the solvent was removed to give the title compound⁹ (4g) as a pale yellow oil (6.300 g, 98%). IR (film): 3295, 3075, 2970, 2947, 2903, 2873, 1750 cm⁻¹. ¹H NMR (CDCl₃, 400 MHz): δ 5.07-4.99 (m, 1H), 4.54-4.48 (m, 1H), 3.16 (ddd, J = 5.7, 4.1, 2.6 Hz, 0.6H), 3.05 (ddd, J = 4.9, 3.9, 2.7 Hz, 0.4H), 2.82 (dd, J = 4.9, 4.2 Hz, 0.6H), 2.77-2.70 (m, 0.8H), 2.67 (dd, J = 4.8, 2.7 Hz, 0.6H), 2.44
(d, J = 2.1 Hz, 0.6H), 2.43 (d, J = 2.1 Hz, 0.4H), 2.08 (s, 1.2H), 2.06 (s, 1.8H), 2.16-1.97 (m, 2H), 0.90 (s, 9H), 0.15 (s, 1.8H), 0.14 (s, 1.2H), 0.12 (s, 1.8H), 0.12 (s, 1.2H). ¹³C NMR (CDCl₃, 101 MHz): δ 171.1, 85.1, 74.5, 74.4, 72.0, 70.9, 60.8, 54.1, 53.2, 46.3, 40.9, 40.7, 26.8, 22.1, 22.0, 19.2, −3.5, −4.1.

HRMS (ESI): m/z calcd. for C₁₅H₂₇O₄Si⁺ [M+H]⁺ 299.1674; found 299.1665.

(5R,7S)-5-Ethynyl-2,2,3,3,10,10-hexamethyl-7-(oxiran-2-yl)-9,9-diphenyl-4,8-dioxo-3,9-disilaundecane (4h). TBDPSCI (0.17 mL, 0.66 mmol) was added dropwise to a solution of 4c (0.085 g, 0.33 mmol) and imidazole (0.050 g, 0.73 mmol) in anhydrous THF (3 mL) at 0 ºC under N₂, and the mixture was warmed to 30 ºC and stirred for 48 h. A 22% solution of NH₄Cl (5 mL) was added slowly and the mixture was stirred for 10 min. MTBE (15 mL) and H₂O (5 mL) were added and the mixture was stirred for 10 min and partitioned. The organic phase was dried (MgSO₄), and the solvent was removed. The resulting oily residue was purified by flash chromatography (silica gel, hexanes-AcOEt 98:2) to give the title compound (4h) as a colorless oil (0.130 g, 79%). IR (film): 3309, 3049, 2956, 2930, 2892, 2857 cm⁻¹. ¹H NMR (CDCl₃, 400 MHz): δ 7.73-7.68 (m, 4H), 7.44-7.32 (m, 6H), 4.70 (ddd, J = 7.6, 6.9, 2.1 Hz, 0.4H), 4.57 (dt, J = 6.8, 2.1 Hz, 0.6H), 3.69-3.57 (m, 1H), 3.11-3.04 (m, 0.6H), 2.90-2.84 (m, 0.6H), 2.67 (dd, J = 4.8, 4.3 Hz, 0.6H), 2.46 (dd, J = 4.9, 2.7 Hz, 0.6H), 2.32-2.28 (m, 0.6H), 2.20 (d, J = 2.1 Hz, 0.4H), 1.99 (m, 1H), 1.91-1.82 (m, 1H), 1.08 (s, 9H), 0.85 (s, 9H), 0.12 (s, 0.6H), 0.09 (s, 2.4H), 0.07 (s, 0.6H), 0.07 (s, 2.4H). ¹³C NMR (CDCl₃, 101 MHz): δ 136.2, 136.1, 136.1, 136.0, 134.0, 133.8, 133.7, 133.4, 130.0, 129.9, 129.8, 129.7, 127.8, 127.7, 127.7, 127.5, 85.1, 84.7, 73.1, 73.0, 72.9, 71.3, 60.1, 60.0, 55.6, 54.5, 46.5, 45.2, 44.6, 43.5, 27.2, 27.1, 25.9, 25.8, 19.6, 19.5, 18.3, 18.2, -4.4, -4.5, -4.9. **General procedure for non-catalytic 5-exo cyclization**

Strictly deoxygenated anhydrous THF (76 mL) was added to a mixture of Cp₂TiCl₂ (1.711 g, 6.87 mmol) and activated Zn powder (1.800 g, 27.48 mmol) under N₂ and the suspension was stirred at rt until it turned lime green. This suspension was then added slowly to a solution of 4b (0.850 g, 2.29 mmol) over 3 h and the mixture was stirred for 15 h at rt. A 22% solution of NH₄Cl (60 mL) was added slowly and the mixture was stirred for 2 h, filtered and the solvent was removed. AcOEt (100 mL) was added and the mixture was stirred for 10 min. The mixture was partitioned and the aqueous phase was extracted with AcOEt (2 × 50 mL). The combined organic phases were dried (MgSO₄) and the solvent was removed. The resulting oily residue was purified by flash chromatography [silica gel, hexanes-
AcOEt, from 95:5 to 80:20 (gradient elution)] to give the title compound as a pale yellow oil (0.424 g, 50%).

(1R,3R,4R)-4-((tert-Butyldimethylsilyloxy)-3-hydroxymethyl-2-methylenecyclopentyl) benzoate (5k). [α]_{D}^{25} –26.4 (c 1.0, CHCl₃). IR (ATR): 3503, 3064, 2954, 2929, 2885, 2856, 1718 cm⁻¹. ¹H NMR (CDCl₃, 400 MHz): δ 8.10-8.04 (m, 2H), 7.61-7.53 (m, 1H), 7.49-7.40 (m, 2H), 5.66-5.61 (m, 1H), 5.37 (t, J = 2.4 Hz, 1H), 5.19 (t, J = 2.4 Hz, 1H), 4.19-4.10 (m, 1H), 3.86-3.80 (m, 2H), 2.81-2.71 (m, 1H), 2.64-2.55 (m, 1H), 1.83 (dt, J = 12.7, 8.4 Hz, 1H), 0.90 (s, 9H), 0.11 (s, 3H), 0.09 (s, 3H). ¹³C NMR (CDCl₃, 101 MHz): δ 166.5, 147.7, 133.1, 130.3, 129.8, 128.5, 112.0, 74.2, 72.2, 62.5, 53.5, 40.5, 25.9, 18.0, -4.3, -4.8. HRMS (ESI): m/z calcd. for C₂₀H₃₁O₄Si⁺ [M+H]⁺ 363.1986; found 363.1988.

Catalytic 5-exo cyclization of 4g

Strictly deoxygenated anhydrous THF (15 mL) was added to a mixture of IrCl(CO)(PPh₃)₂ (0.260 g, 0.34 mmol) and manganese powder (0.368 g, 6.70 mmol). A solution of 2,4,6-collidine (3.5 mL, 26.8 mmol) and 4g (1.000 g, 3.35 mmol) in strictly deoxygenated anhydrous THF (22 mL) was added at rt. TMSCl (1.7 mL, 13.4 mmol) was added followed by a solution of Cp₂TiCl₂ (0.167 g, 0.67 mmol) in strictly deoxygenated anhydrous THF (12 mL) and the mixture was stirred for 4 h under H₂ (4 bar) at rt. Water (5 mL) was added and the mixture was stirred for 10 min and filtered through Celite®. The pad was washed with MTBE (20 mL) and the organic phases were combined and acidified to pH=2 with 2 M HCl. The mixture was stirred for 15 min and the phases were separated. The organic phase was washed with H₂O (20 mL) and dried (Na₂SO₄). The solvent was removed and the resulting oily residue was purified by flash chromatography [silica gel, hexanes-AcOEt, from 90:10 to 60:40 (gradient elution)] to give the title compound (5g) as a pale yellow oil (0.582 g, 58%).

(1R,3R,5S)-5-Acetoxy-3-((tert-butyldimethylsilyloxy)-2-methylenecyclopentyl)methyl 4-nitrobenzoate (5l). NEt₃ (0.65 ml, 4.62 mol) was added dropwise to a solution of 5g (1.000 g, 3.33 mmol) and a catalytic amount of DMAP in anhydrous CH₂Cl₂ (9 mL) at 0 °C under N₂. A solution of p-nitrobenzoyl chloride (0.740 g, 3.99 mmol) in anhydrous CH₂Cl₂ (4 mL) was added dropwise at 0–5 °C. The mixture was allowed to warm to rt and was stirred for 2 h. Saturated NH₄Cl (10 mL) was added slowly and the mixture was stirred for 15 min. The mixture was partitioned and the organic phase was
washed with H₂O and dried (Na₂SO₄). The solvent was removed and the resulting oily residue was purified by flash chromatography (silica gel, hexanes-AcOEt 90:10) to give the title compound (5l) as white solid (1.102 g, 74% yield). Mp 83 °C. [α]D²⁵ –8.6 (c 1.0, CHCl₃). IR (ATR): 2981, 2959, 2944, 2884, 2858, 1730, 1713 cm⁻¹. ¹H NMR (CDCl₃, 400 MHz): δ 8.31-8.13 (m, 4H), 5.27 (t, J = 2.3 Hz, 1H), 5.13 (t, J = 2.3 Hz, 1H), 5.05 (dt, J = 8.4, 6.6 Hz, 1H), 4.48 (m, 3H), 3.18-3.08 (m, 1H), 2.59-2.44 (m, 1H), 1.99 (s, 3H), 1.79-1.64 (m, 1H), 0.91 (s, 9H), 0.10 (s, 3H), 0.09 (s, 3H). ¹³C NMR (CDCl₃, 101 MHz): δ 170.9, 164.6, 150.7, 150.5, 135.5, 130.8, 123.7, 110.1, 73.2, 72.5, 66.3, 46.9, 40.5, 25.9, 21.2, 18.3, –4.5, –4.6. HRMS (ESI): m/z calcd. for C₂₂H₃₂NO₇Si⁺ [M+H]⁺ 450.1943; found 450.1947.

((1R,3R,5S)-5-Acetoxy-3-hydroxy-2-methylene cyclopentyl)methyl 4-nitrobenzoate (5m). (+)-Camphorsulfonic acid ((+)-CSA, 0.034 g, 0.15 mmol) was added to a solution of 5l (0.660 g, 1.47 mmol) in anhydrous MeOH (7 mL) at rt under N₂. The mixture was stirred for 2 h and was then cooled to 0 °C and stirred for 1 h. The pH was adjusted to 6.5 by adding 1% NaHCO₃ solution. The MeOH was removed in vacuo and the aqueous layer was extracted with MTBE. The organic phase was dried (Na₂SO₄), the solvent was removed and the resulting oily residue was purified by flash chromatography (silica gel, hexanes-AcOEt 60:40) to give the title compound (5m) as a white solid (0.439 g, 89%). Mp 73 °C. [α]D²⁵ –32.7 (c 1.0, CHCl₃). IR (KBr): 3460, 3109, 3074, 3050, 2990, 2927, 1722 cm⁻¹. ¹H NMR (CDCl₃, 400 MHz): δ 8.26-8.22 (m, 4H), 5.44 (bs, 1H), 5.25 (d, J = 1.5 Hz, 1H), 5.17 (q, J = 5.5 Hz, 1H), 4.56-4.54 (m, 1H), 4.52–4.43 (m, 1H), 4.42–4.30 (m, 1H), 3.21-3.18 (m, 1H), 2.53-2.49 (m, 1H), 2.02 (s, 3H), 1.85 (dt, J = 12.4, 5.5 Hz, 1H). ¹³C NMR (CDCl₃, 101 MHz): δ 170.6, 164.6, 151.3, 150.8, 135.4, 130.8, 123.8, 112.3, 74.8, 73.2, 65.9, 47.9, 40.1, 21.3. HRMS (ESI): m/z calcd. for C₁₆H₂₁N₂O₇⁺ [M+NH₄]⁺ 353.1343; found 353.1328.

((1R,3S,5S)-5-Acetoxy-3-(2-amino-6-chloro-9H-purin-9-yl)-2-methylene cyclopentyl)methyl 4-nitrobenzoate (13). A mixture of 2-amino-6-chloropurine (7.380 g, 43.54 mmol) and triphenylphosphine (11.400 g, 43.54 mmol) in anhydrous THF (927 mL) at rt under N₂ was stirred for 15 min. After cooling to -10 °C, diisopropyl azodicarboxylate (DIAD, 8.60 mL, 43.54 mmol) was added
dropwise and the mixture was stirred for 10 min. A solution of 5m (7.300 g, 21.77 mmol) in anhydrous THF (160 mL) was added over 1 h. The mixture was stirred for 3 h at -10 °C and was then allowed to warm to rt, filtered and the residue was washed with THF (109 mL). The solvent was removed and the resulting oily residue was purified by crystallization from isopropanol (440 mL) to afford the title compound as a pale yellow solid (6.510 g, 61%). Mp 113 °C. [α]_D^{25} +9.8 (c 1.0, CHCl₃). IR (KBr): 3498, 3382, 3213, 3082, 2970, 1728, 1715 cm⁻¹. ¹H NMR (CDCl₃, 400 MHz): δ 8.28 (dd, J = 20.6, 8.9 Hz, 4H), 7.80 (s, 1H), 5.58–5.40 (m, 2H), 5.35–5.30 (m, 1H), 4.91 (bs, 1H), 4.85 (dd, J = 11.4, 9.3 Hz, 1H), 4.62 (dd, J = 11.4, 6.3 Hz, 1H), 3.28–3.24 (m, 1H), 2.85 (ddd, J = 14.3, 10.6, 5.2 Hz, 1H), 2.42 (dd, J = 14.3, 8.1 Hz, 1H), 2.08 (s, 3H). ¹³C NMR (CDCl₃, 101 MHz): δ 170.3, 165.0, 158.9, 153.1, 151.8, 146.2, 141.9, 135.2, 130.9, 125.9, 123.8, 113.6, 74.6, 65.9, 57.4, 48.7, 35.5, 21.3. HRMS (ESI): m/z calcd. for C_{21}H_{20}ClN₆O₆+ [M+H]^+ 487.1127; found 487.1132.

(1R,3S,5S)-5-Acetoxy-3-(2-amino-6-oxo-1H-purin-9(6H)-yl)-2-methylenecyclopentyl)methyl 4-nitrobenzoate (14). A solution of 13 (6.300 g, 12.94 mmol) in formic acid 80% (126 mL) at 50 °C under N₂ was stirred for 9 h. The solvent was removed, H₂O (72 mL) was added and the suspension was stirred for 18 h at rt. The suspension was filtered and the solid was dried to afford the title compound (14) as a yellow solid (5.590 g, 92%). Mp 282 °C. [α]_D^{25} +2.9 (c 1.0, DMSO). IR (KBr): 3408, 3315, 3210, 3110, 2934, 2868, 1728, 1706 cm⁻¹. ¹H NMR (DMSO-d₆, 400 MHz) δ: 11.08 (bs, 1H), 8.37 (d, J = 8.8 Hz, 2H), 8.24 (d, J = 8.8 Hz, 2H), 7.74 (s, 1H), 6.66 (bs, 2H), 5.42-5.35 (m, 1H), 5.35-5.31 (m, 1H), 5.27 (bs, 1H), 4.67 (bs, 1H), 4.59-4.55 (m, 2H), 3.17-3.10 (m, 1H), 2.70 (ddd, J = 13.6, 11.3, 5.3 Hz, 1H), 2.34-2.25 (m, 1H), 2.01 (s, 3H). ¹³C NMR (DMSO-d₆, 101 MHz) δ: 169.9, 164.3, 156.8, 153.5, 151.2, 150.3, 147.8, 136.1, 135.1, 130.7, 123.9, 116.5, 111.2, 74.1, 65.6, 55.2, 47.8, 35.2, 21.0. HRMS (ESI): m/z calcd. for C_{21}H_{21}N₆O₇⁺ [M+H]^+ 487.1466; found 487.1461.

2-Amino-9-((1S,3R,4S)-4-hydroxy-3-(hydroxymethyl)-2-methylenecyclopentyl)-1H-purin-6(9H)-one monohydrate (1). A solution of MeONa (30%, 4.10 mL, 22.20 mmol) was added dropwise to a solution of 14 (5.200 g, 11.10 mmol) in anhydrous MeOH (40 mL) at rt under N₂. The mixture was
stirred for 30 min at rt and cooled to 0 °C. MTBE (52 mL) was added and the mixture was neutralized (pH=7) with HCl. The phases were separated and the aqueous layer was extracted with MTBE (50 mL). The volume of the aqueous phase was reduced to 45 mL by distillation. The suspension was heated at 85 °C and was slowly cooled to rt and stirred for 15 h. After filtration the isolated solid was dried under vacuum to afford the title compound (1) as a white solid with a 6.5% water content (as determined by Karl Fischer titration) and 98.8% HPLC purity (2.370 g, 72% yield). This white solid 15a was recrystallized from water to afford 1 (2.102 g, 64% overall yield, 99.47 % HPLC purity) with a 6.7% water content (as determined by Karl Fischer titration). Mp 248 °C. [α]D 25 +35.0 (c 0.4, H2O). IR (ATR): 3445, 3361, 3296, 3175, 3113, 2951, 2858, 2626, 1709 cm⁻¹. 1H NMR (DMSO-d6, 400 MHz) δ: 10.59 (s, 1H), 7.66 (s, 1H), 6.42 (bs, 2H), 5.36 (ddt, J = 10.6, 7.8, 2.7 Hz, 1H), 5.10 (dd, J = 2.7, 2.2 Hz, 1H), 4.87 (d, J = 3.1 Hz, 1H), 4.84 (t, J = 5.3 Hz, 1H), 4.56 (t, J = 2.4 Hz, 1H), 4.23 (m, 1H), 3.53 (m, 2H), 2.52 (m, 1H), 2.22 (ddt, J = 12.6, 10.8, 4.6 Hz, 1H), 2.04 (ddt, J = 12.6, 7.7, 1.9 Hz, 1H). 13C NMR (DMSO-d6, 101 MHz) δ: 156.9, 153.5, 151.5, 151.3, 136.0, 116.2, 109.3, 70.4, 63.1, 55.2, 54.1, 39.2. HRMS (ESI): m/z calcd. for C12H16N5O3+ [M+H]+ 278.1253; found 278.1262.
