

UNIVERSITAT DE BARCELONA
FACULTAT DE MEDICINA

**Estudi experimental del paper del factor activador de les
plaquetes en la meningitis i la pneumònia pneumocòciques**

Memòria presentada per M^a Carmen Cabellos Mínguez per a
optar al grau de Doctora en Medicina i Cirurgia

7. CONCLUSIONS

7. CONCLUSIONS

Respecte a la capacitat inflamatòria del factor activador de les plaquetes.

1. El factor activador de les plaquetes és inflamatori al sistema nerviós central, produint augment de la permeabilitat de la barrera hematoencefàlica amb augment de la concentració de proteïnes al LCR, i edema cerebral, però produeix només moderada pleocitosi al LCR.
2. El factor activador de les plaquetes és inflamatori al pulmó, produint augment en la concentració de proteïnes i acúmul de leucòcits.

Respecte al paper del factor activador de les plaquetes en el curs de la meningitis i de la pneumònia pneumocòcica.

3. L'activitat inflamatòria del factor activador de les plaquetes té significat biològic a la meningitis i la pneumònia pneumocòciques, donat que el seu antagonista és capaç de reduir l'exudació de proteïnes generada per *S. pneumoniae* a l'espai subaracnoïdal i al rentat broncoalveolar.

4. L'antagonista del factor activador de les plaquetes només és capaç de reduir la presència de leucòcits generada per *S. pneumoniae* a l'espai subaracnoïdal, però no al pulmó. Això indica que el mecanisme de reclutament de leucòcits és probablement diferent al sistema nerviós central i al pulmó.

5. La combinació d'anticòs monoclonal IB4 i l'antagonista del factor activador de les plaquetes evita en gran part la presència de leucòcits generada per *S. pneumoniae* al rentat broncoalveolar. Aquest fet suggereix que pot haver-hi reclutament de leucòcits dependent del factor activador de les plaquetes i independent de la molècula CR3 dels leucòcits al pulmó, però no al sistema nerviós central.

6. L'antagonista del factor activador de les plaquetes evita la pleocitosi generada per *S. pneumoniae*, però no la generada per *H. influenzae*.

Respecte a la capacitat dels components pneumocòcics per actuar com anàlegs del factor activador de les plaquetes.

7. Existeix reactivitat creuada entre la paret cel.lular pneumocòcica i el factor activador de les plaquetes.

8. L'anticòs anti-paret TEPC-15 evita l'edema cerebral produït pel factor activador de les plaquetes, però no l'augment en la concentració de proteïnes.

9. L'antagonista del factor activador de les plaquetes, redueix la pleocitosi i la concentració de proteïnes, però no l'edema cerebral generats en resposta a la paret cel.lular pneumocòcica a l'espai subaracnoïdal.

10. L'antagonista del factor activador de les plaquetes és incapàç de reduir la inflamació produïda per l'àcid lipoteicoic pneumocòcic a l'espai subaracnoïdal.

11. La paret cel.lular pneumocòcica i l'àcid lipoteicoic pneumocòcic no tenen activitat similar al factor activador de les plaquetes, ni capacitat d'inhibició competitiva en assaigs específics pel factor activador de les plaquetes d'agregació plaquetar i de degranulació de neutròfils.

12. La intensitat de la inflamació associada amb la infecció pneumocòcica al sistema nerviós central i al pulmó està augmentada per una especial participació del factor activador de les plaquetes endogen en la resposta inflamatòria als components de la paret cel.lular pneumocòcica.
